VDEQ 2010 Impared Waters (Categories 4 and 5) Mapping

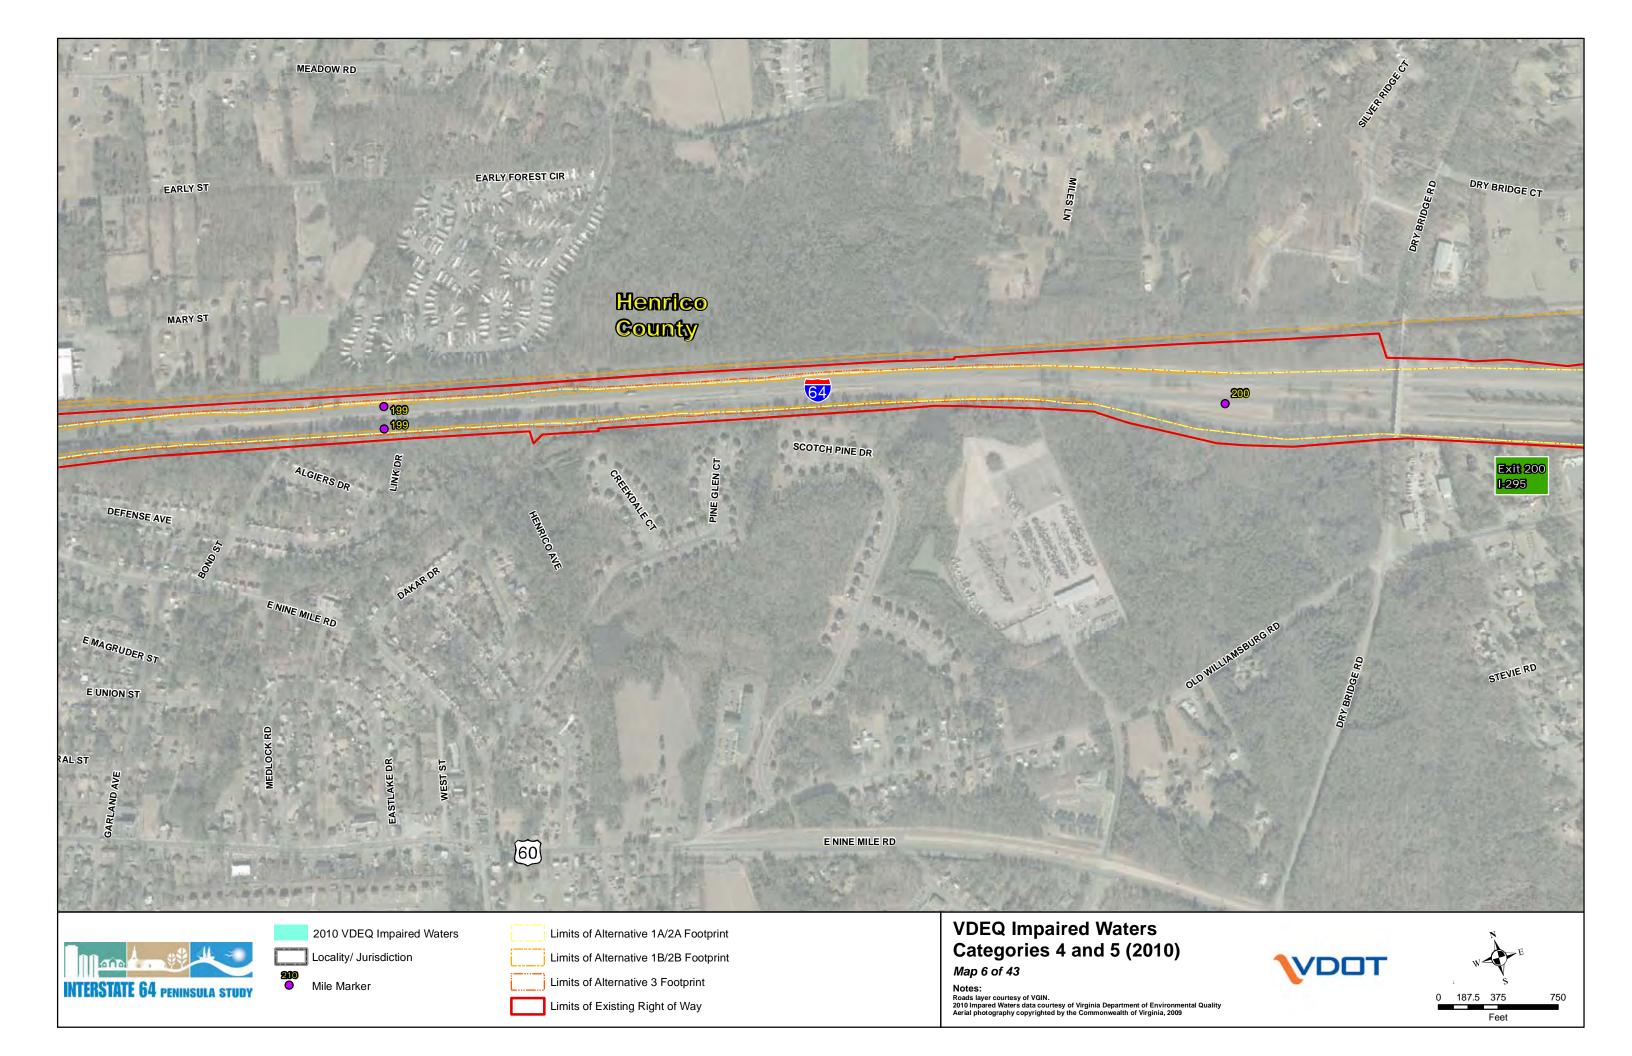

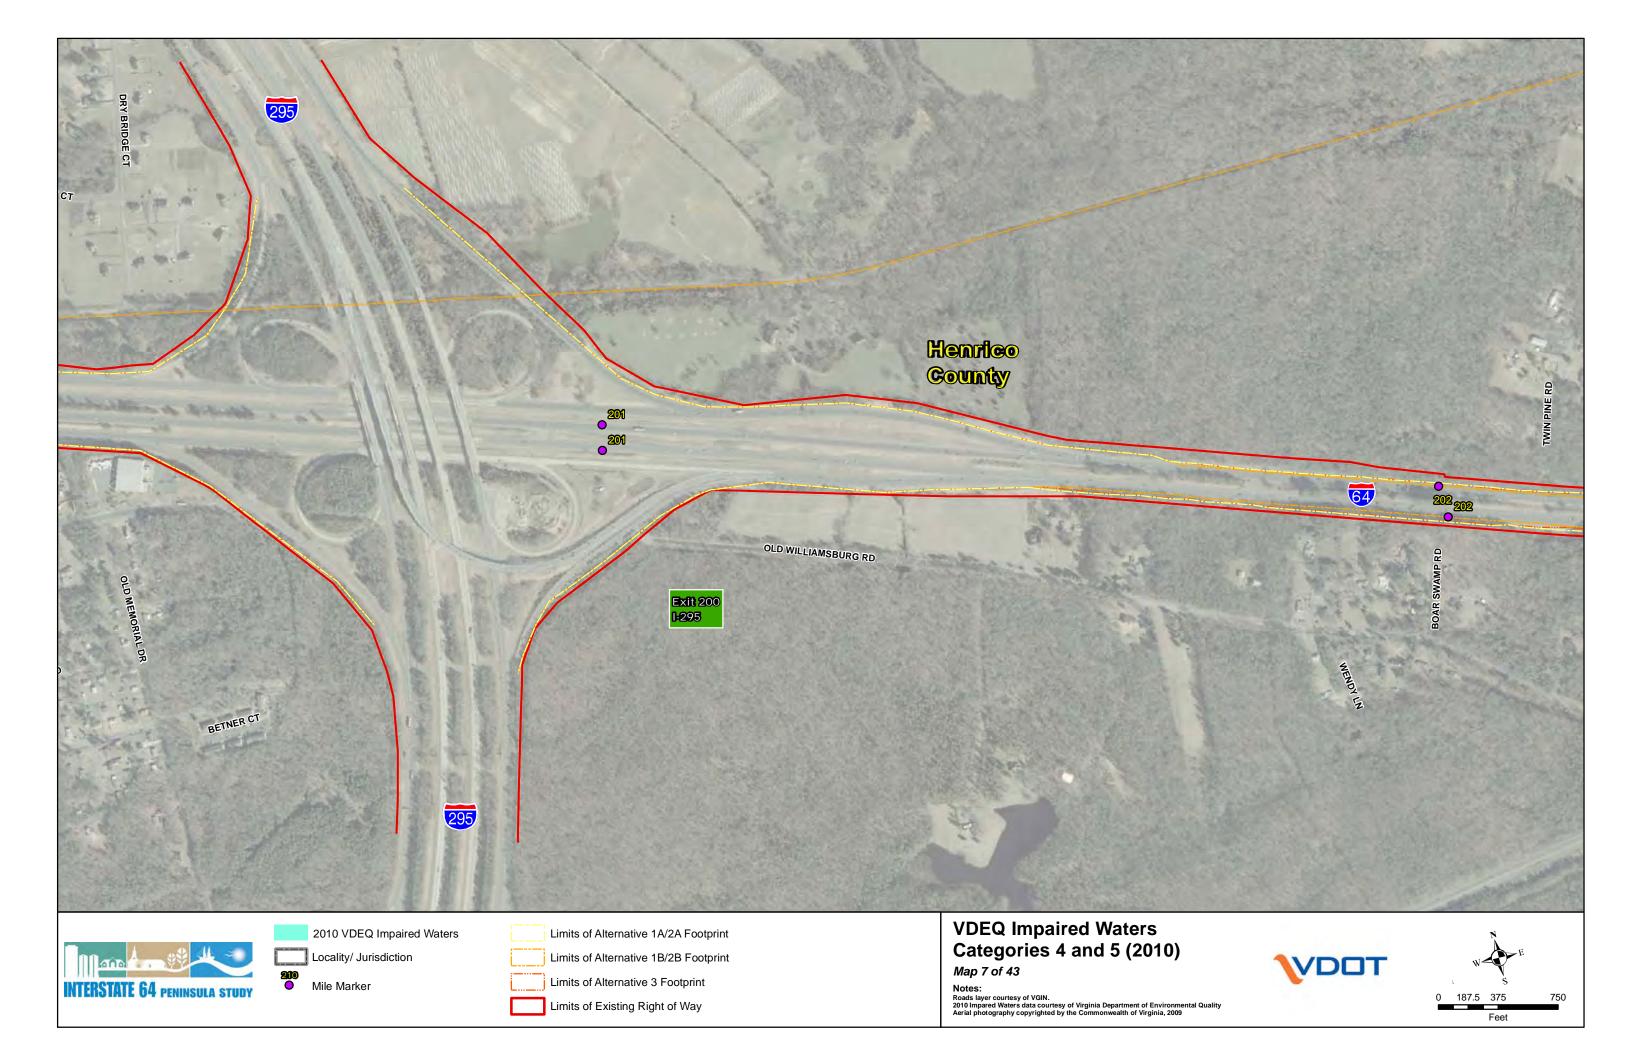

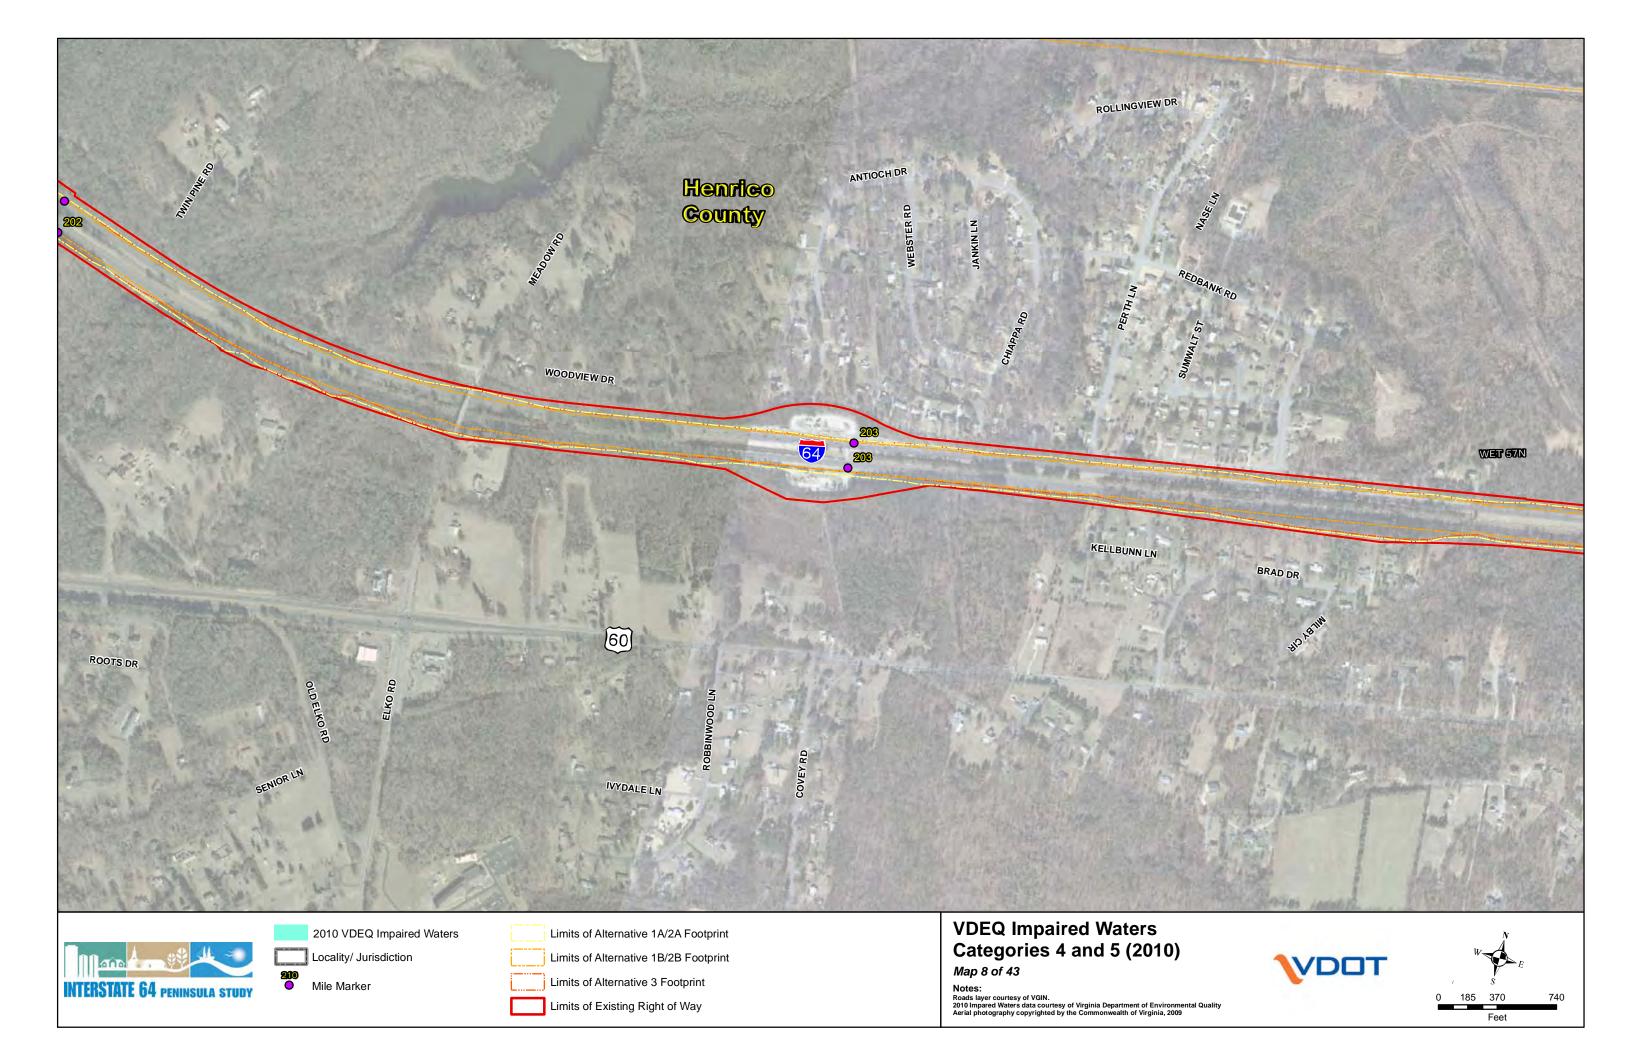

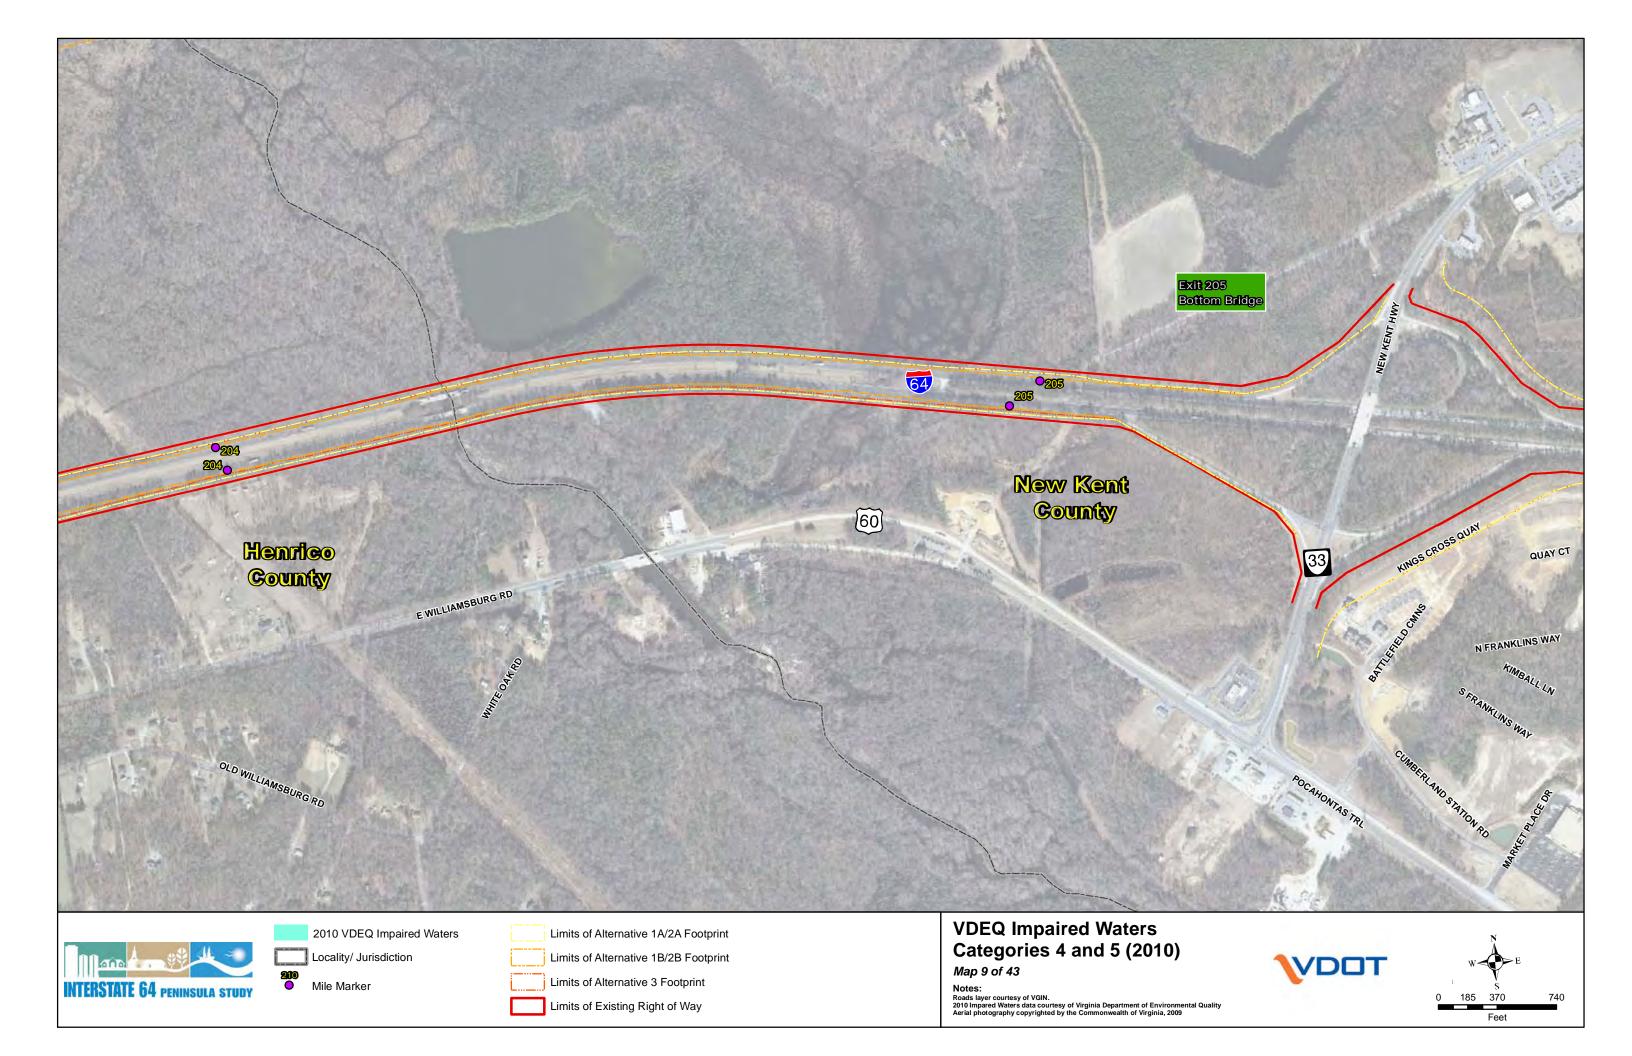

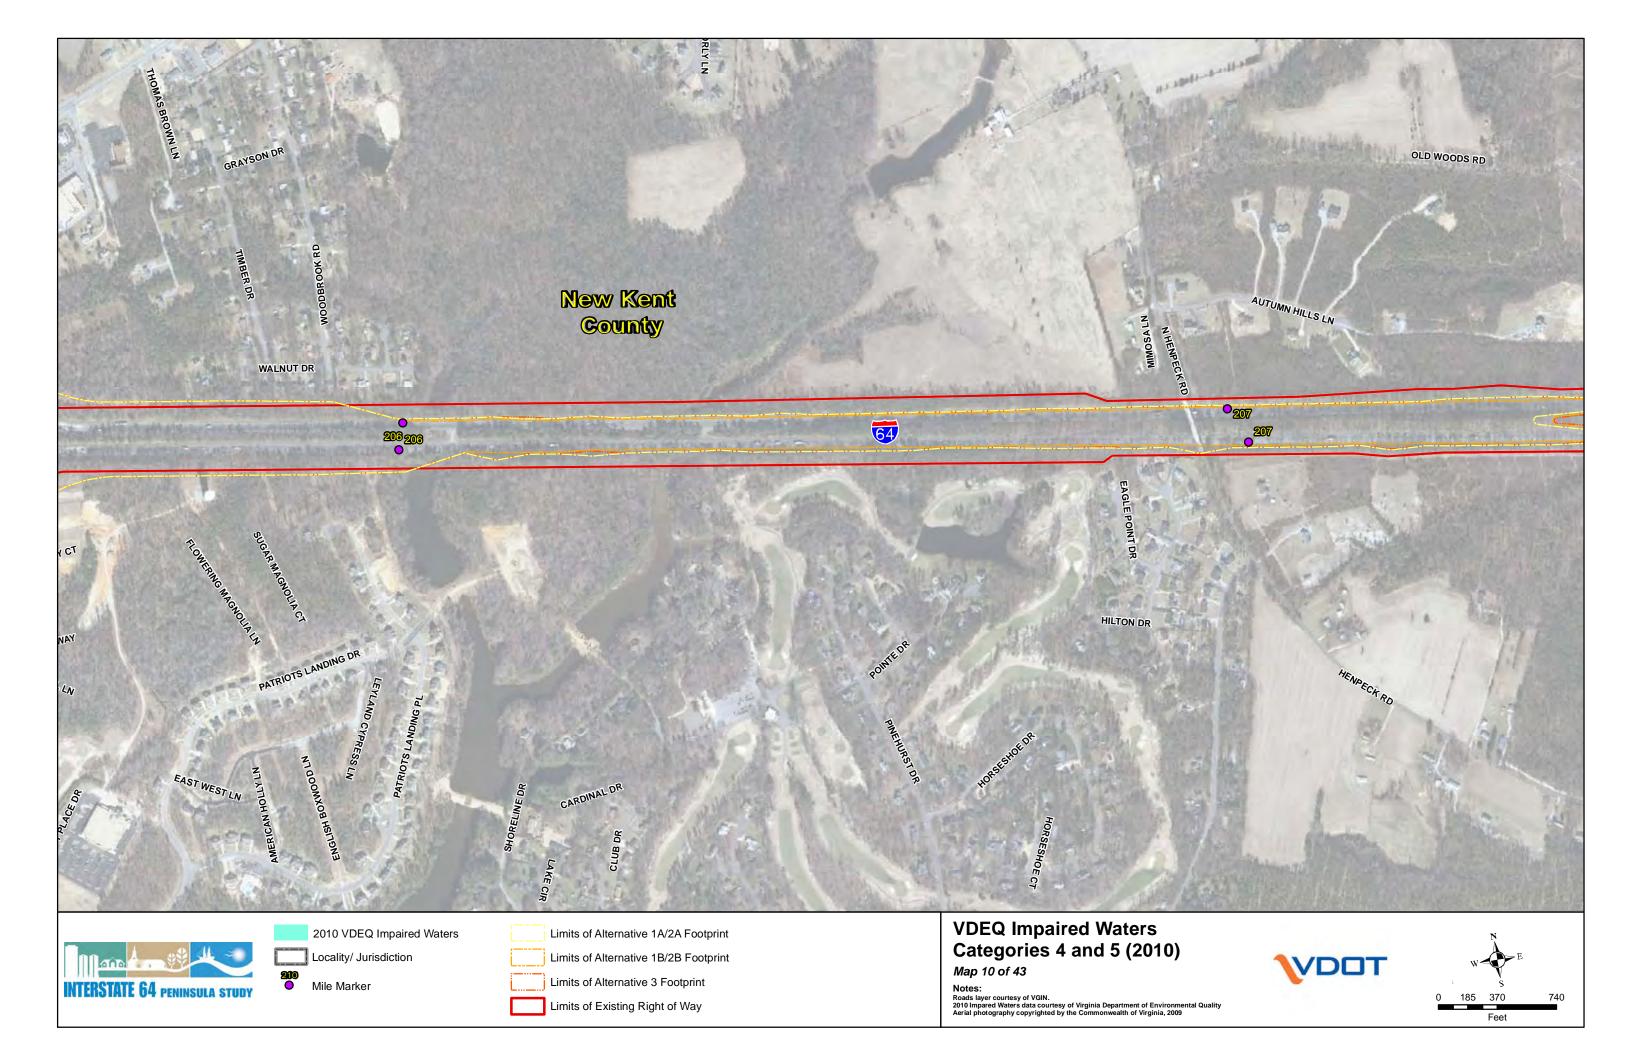

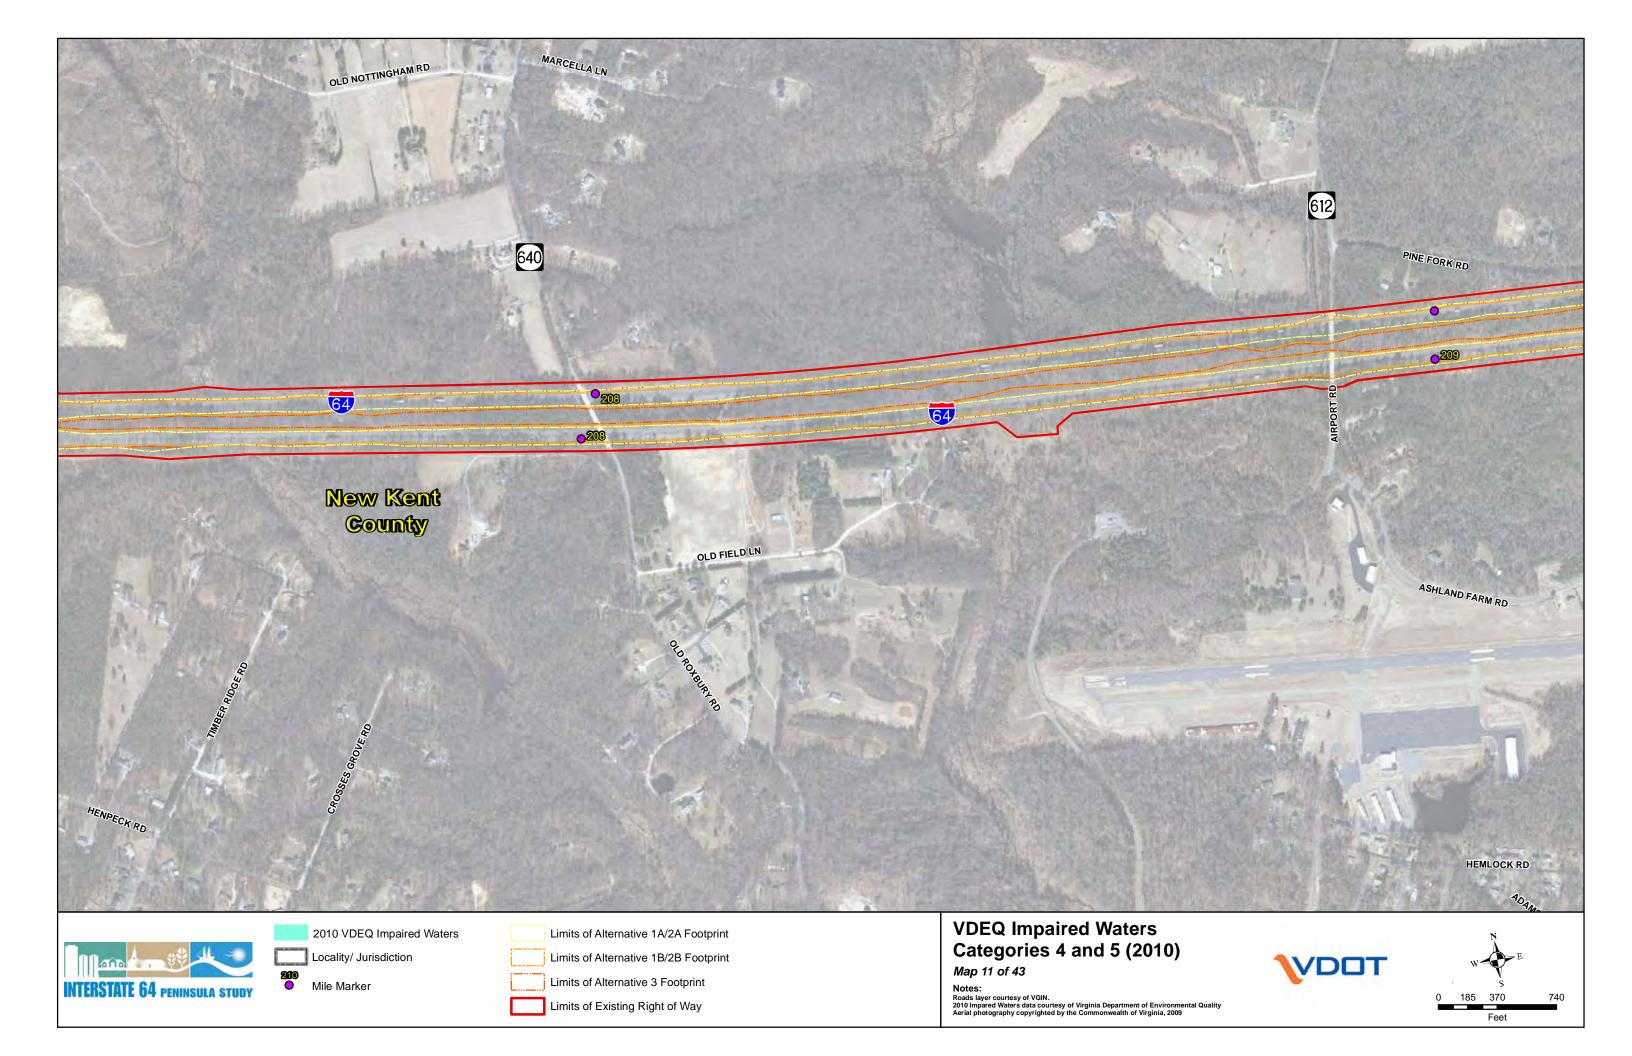

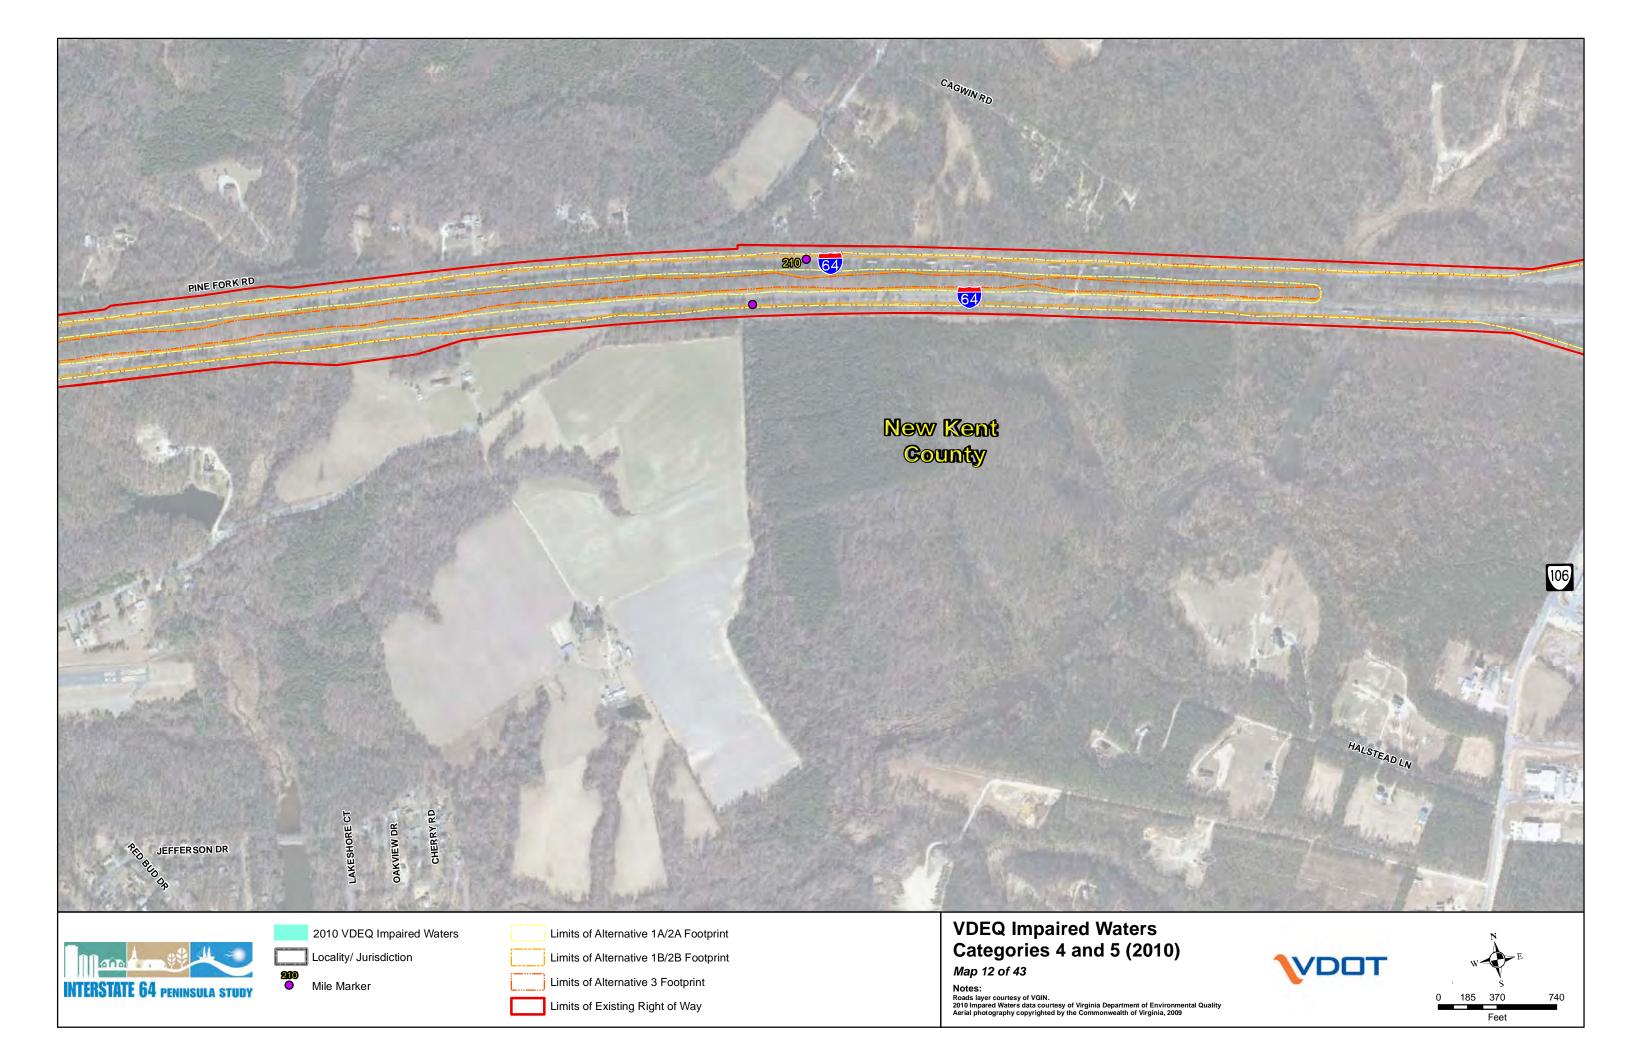

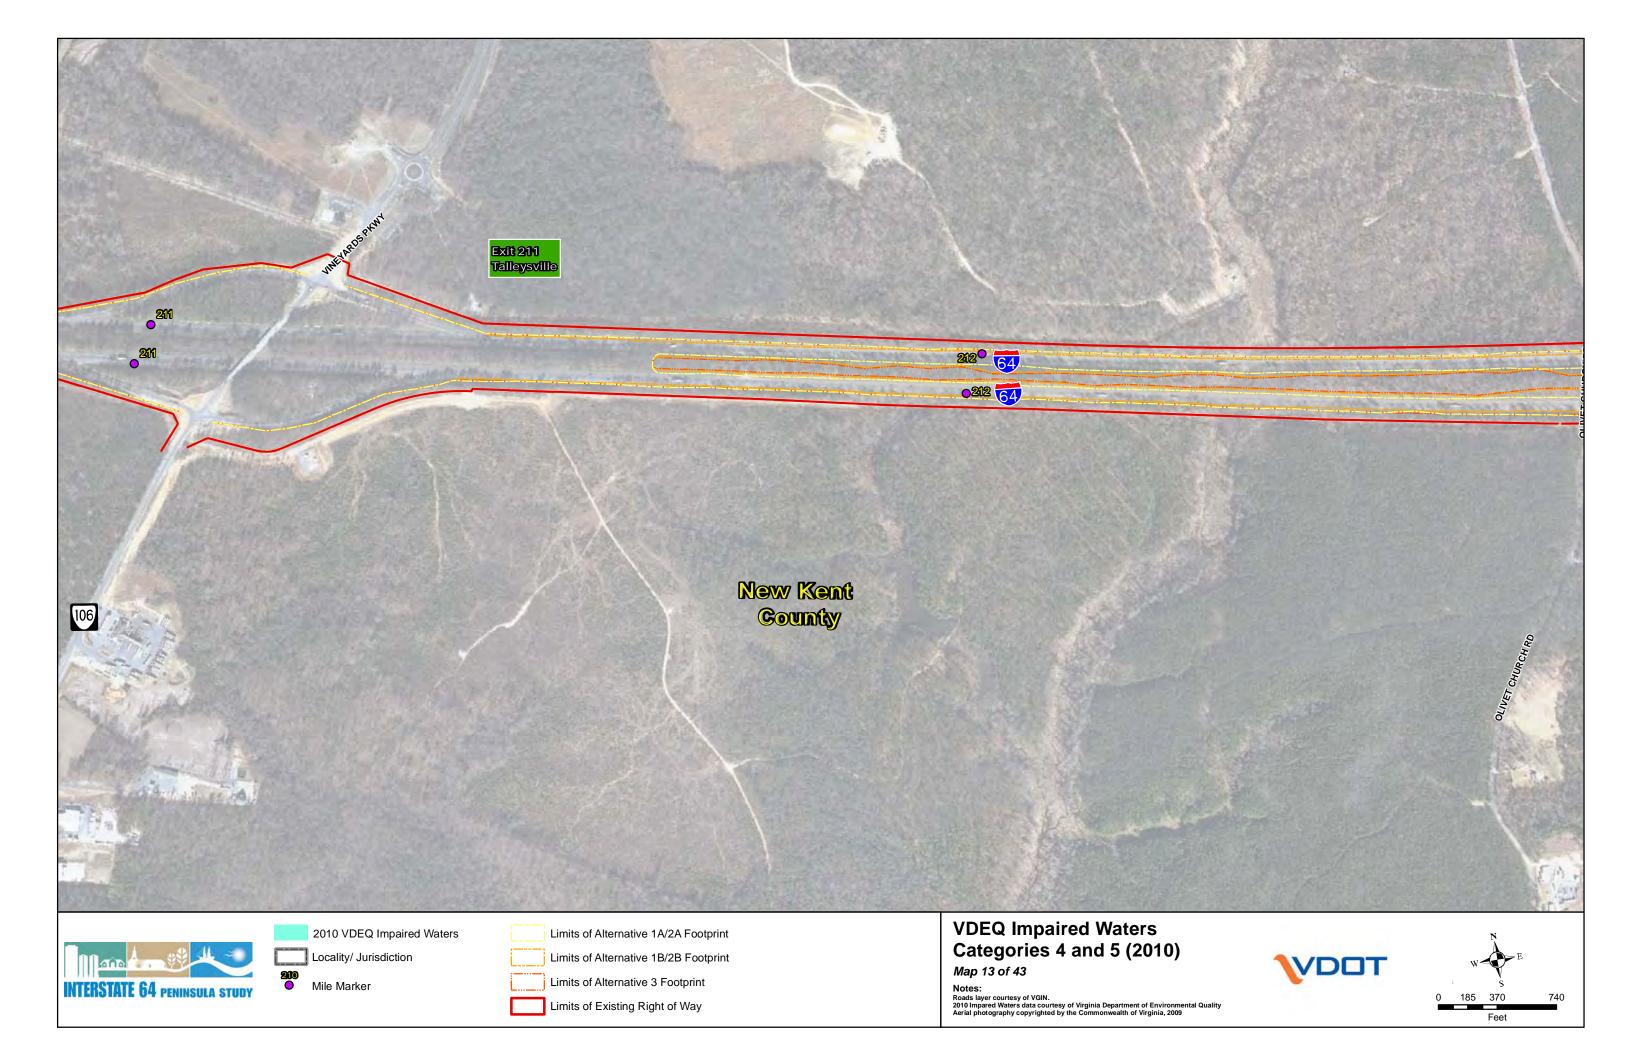

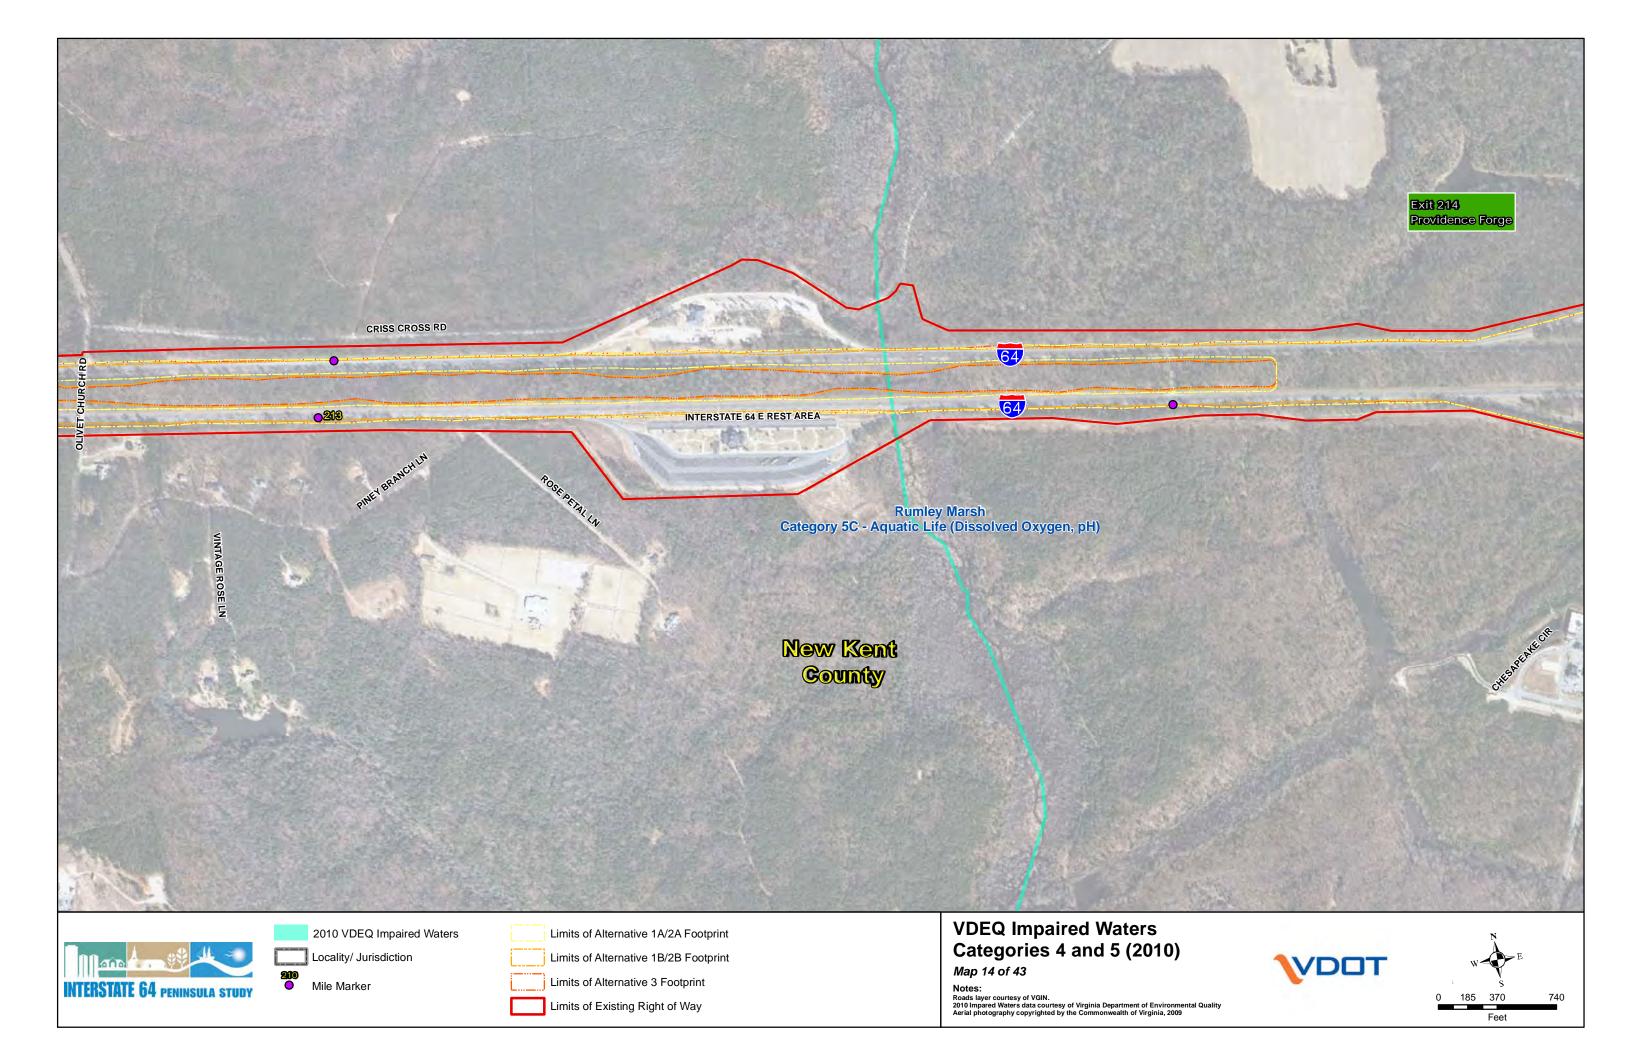

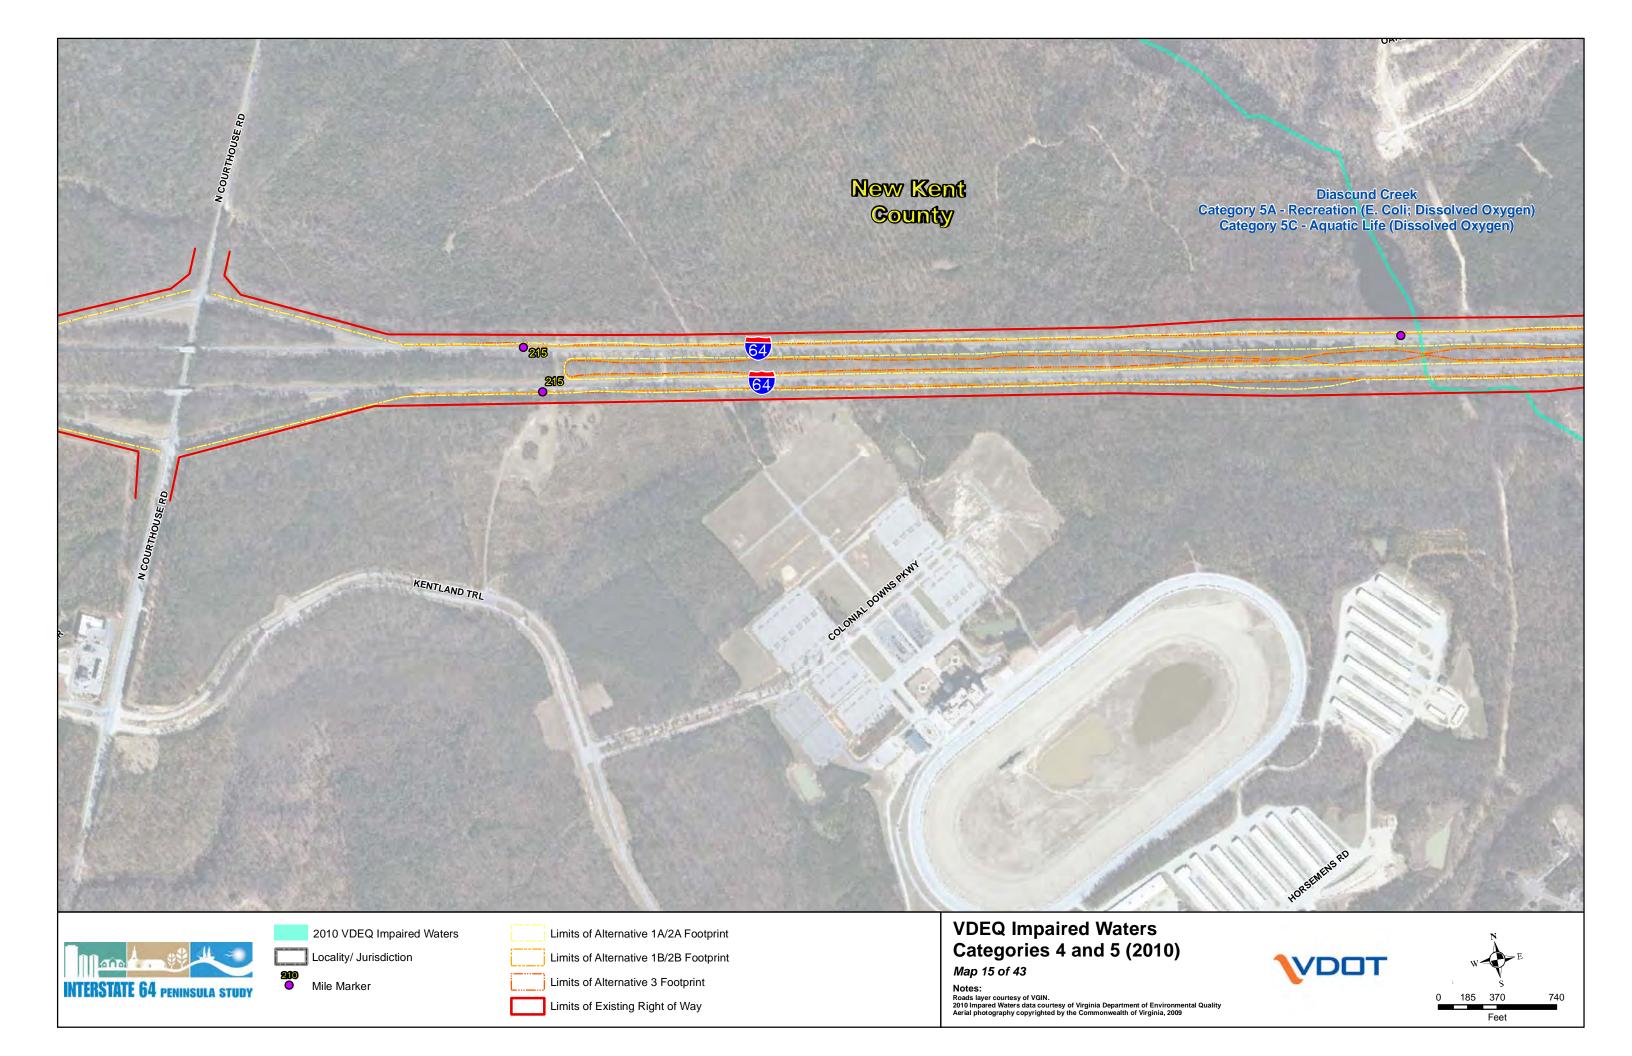

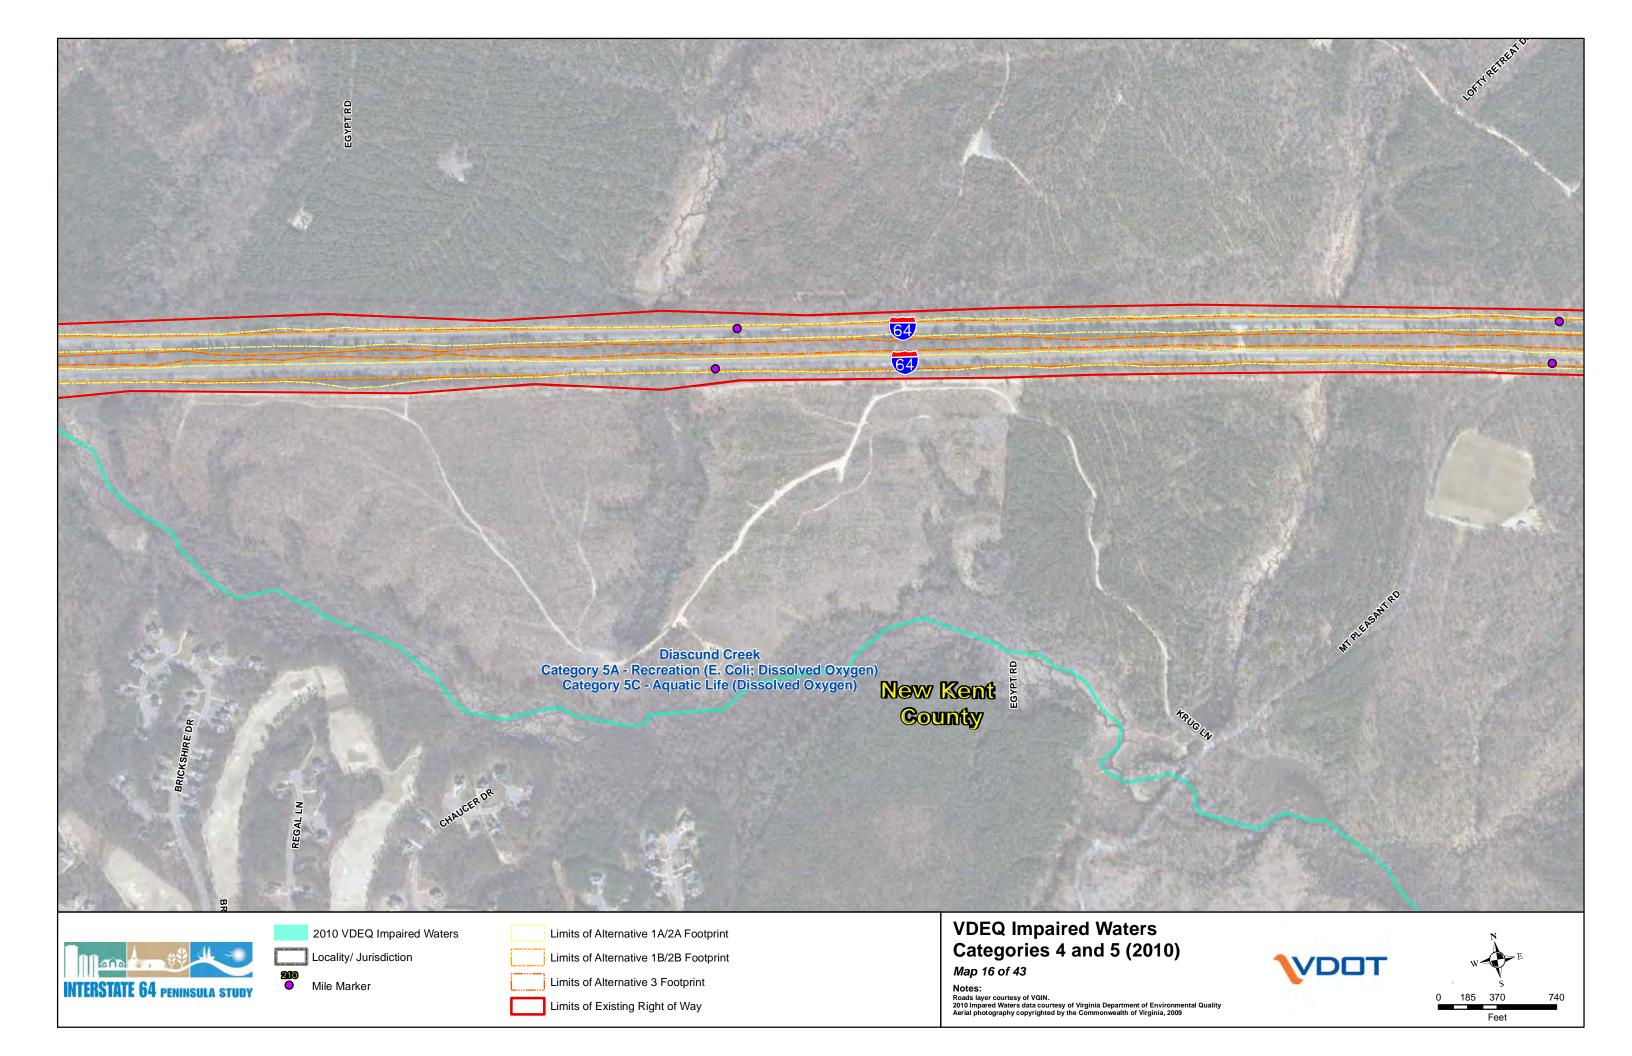

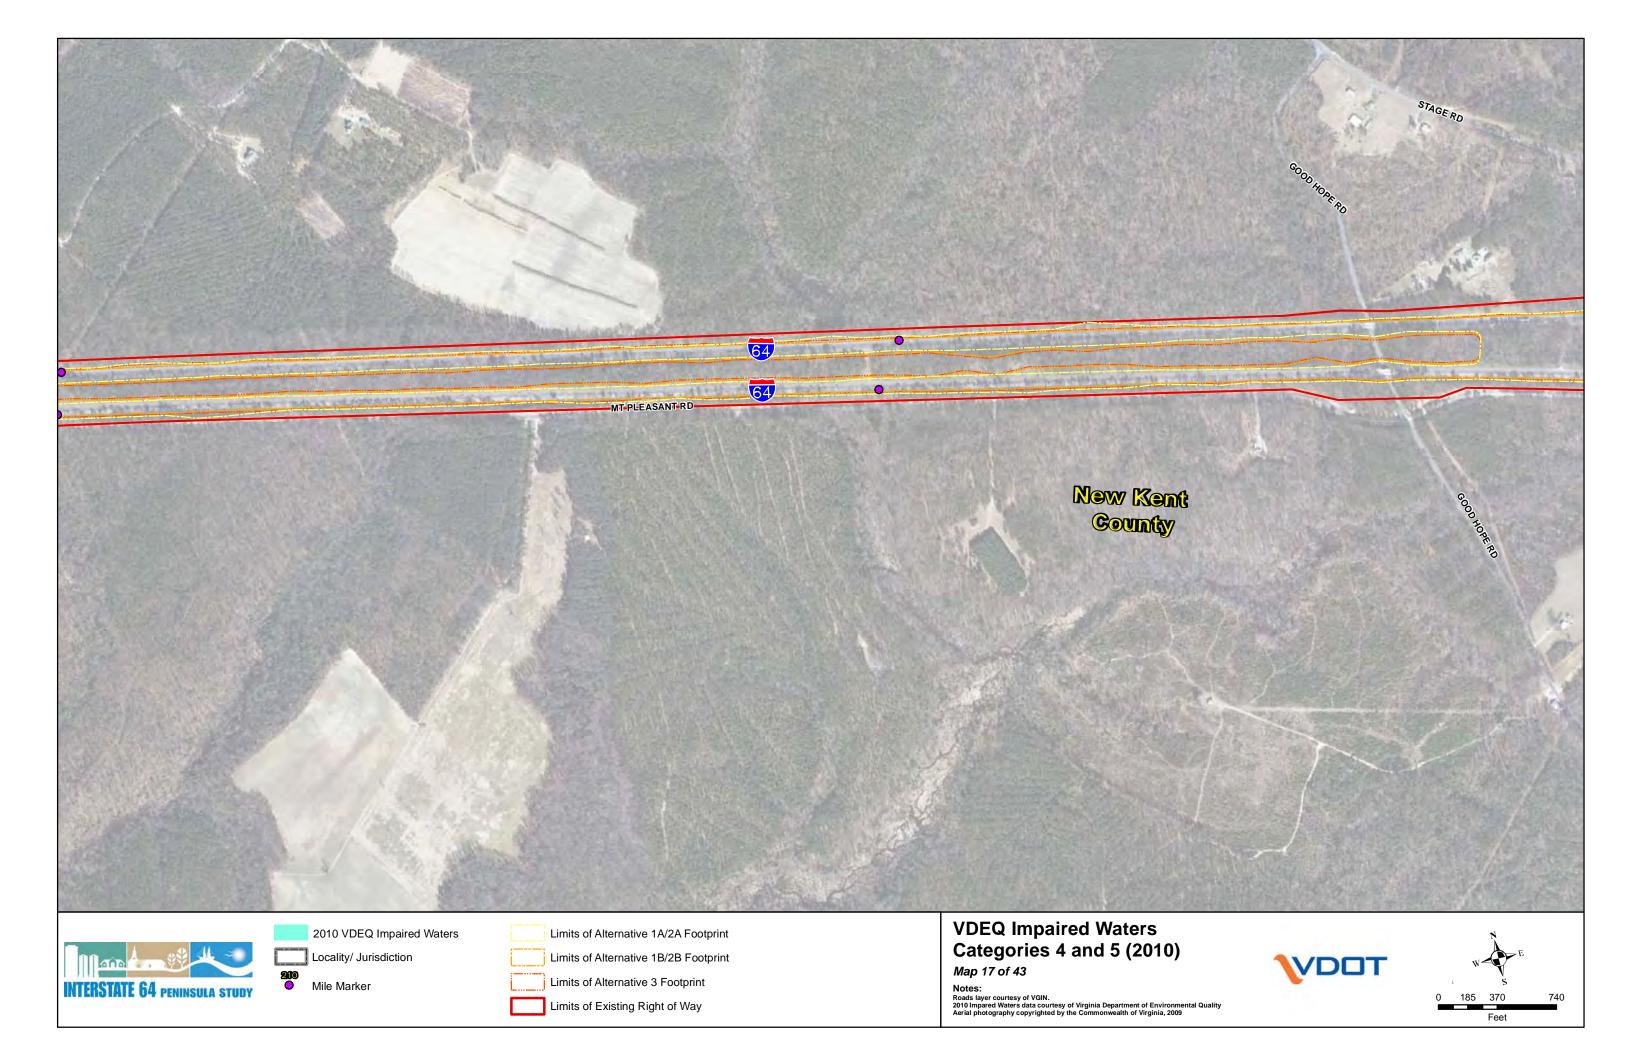

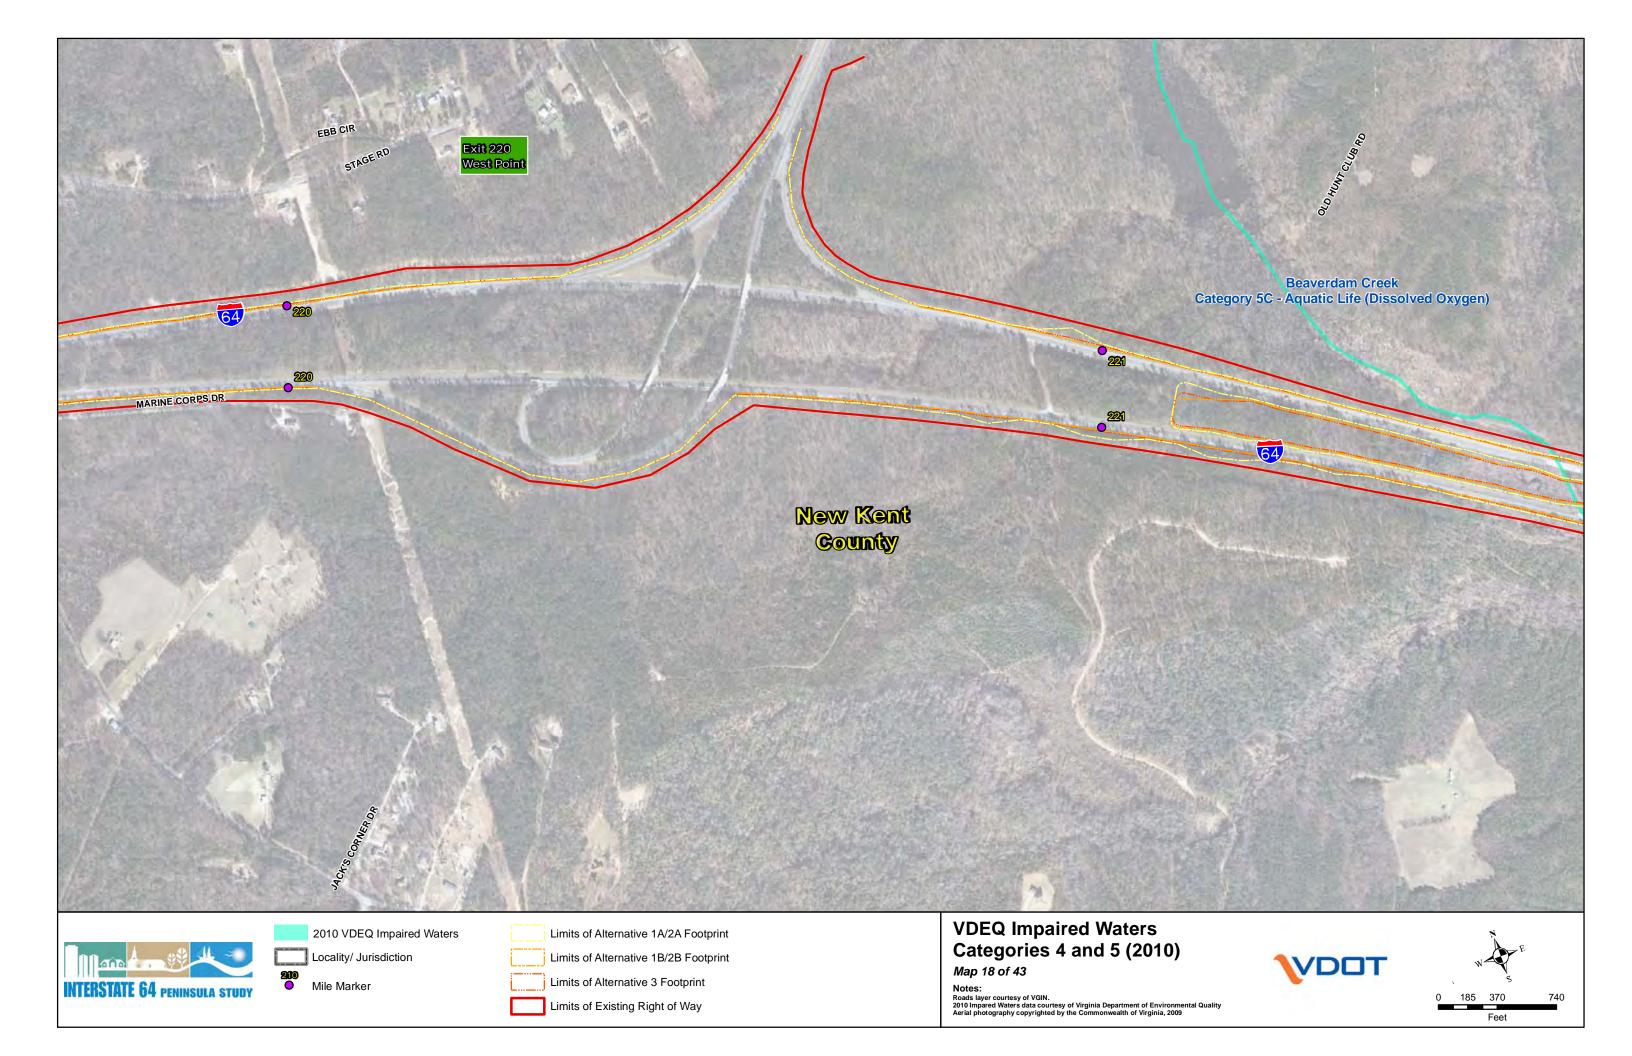

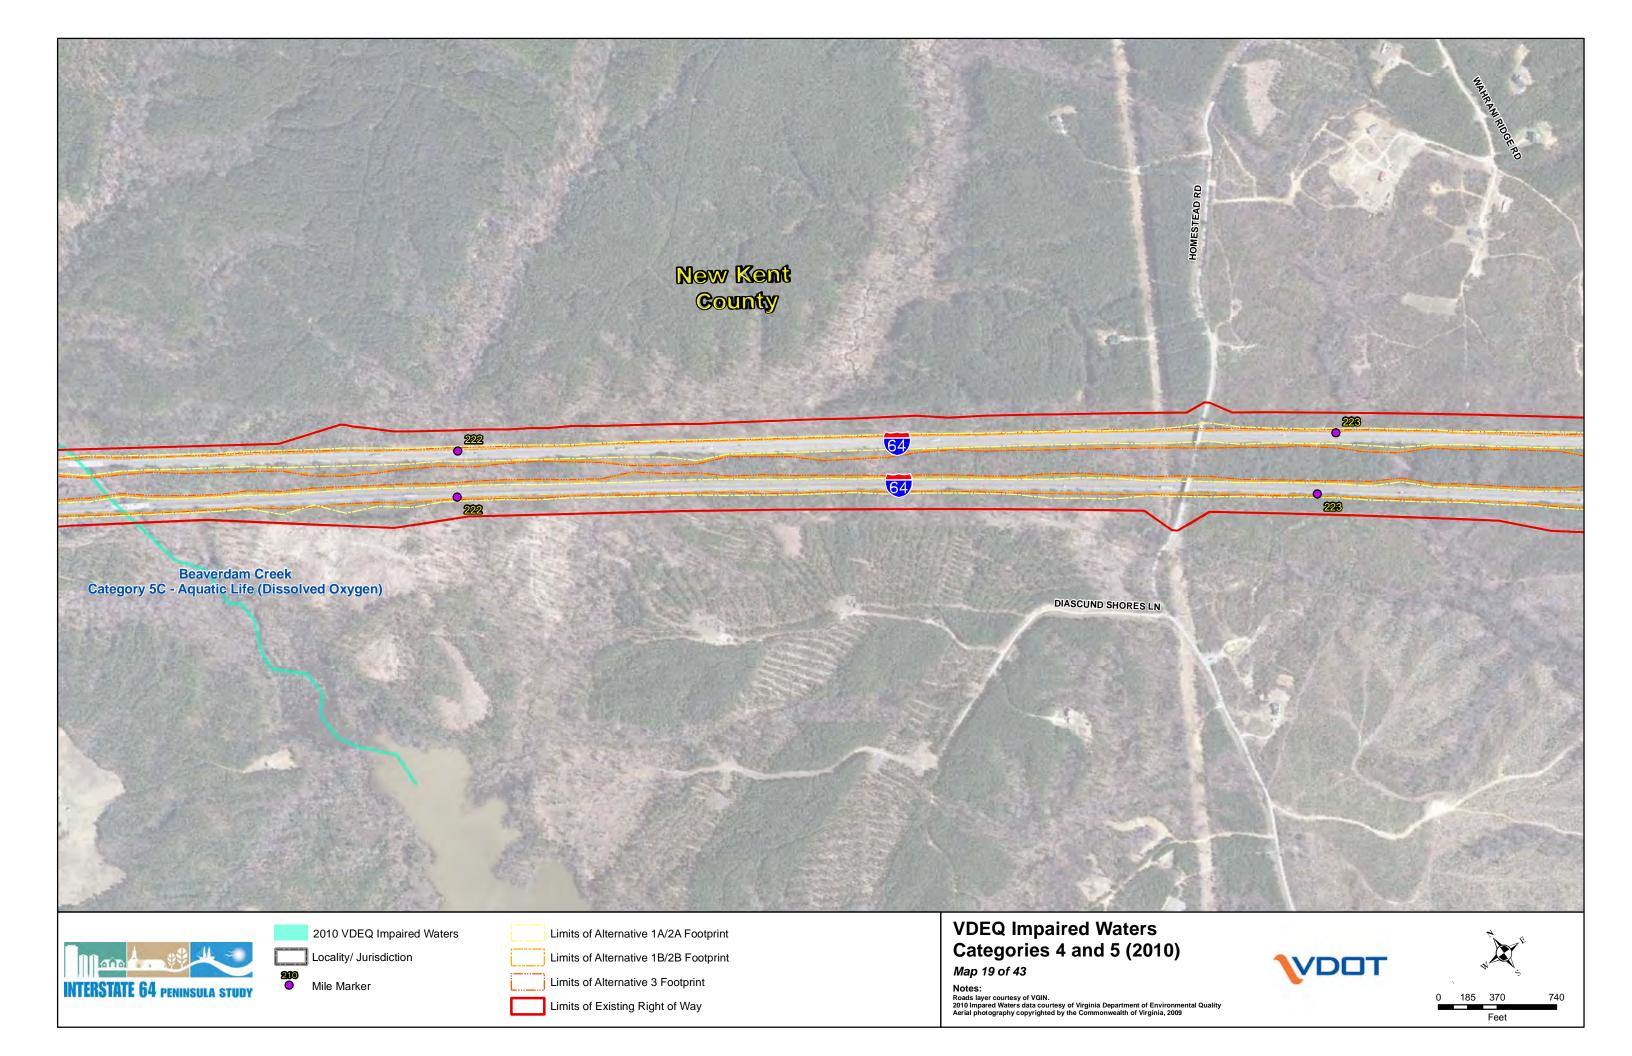

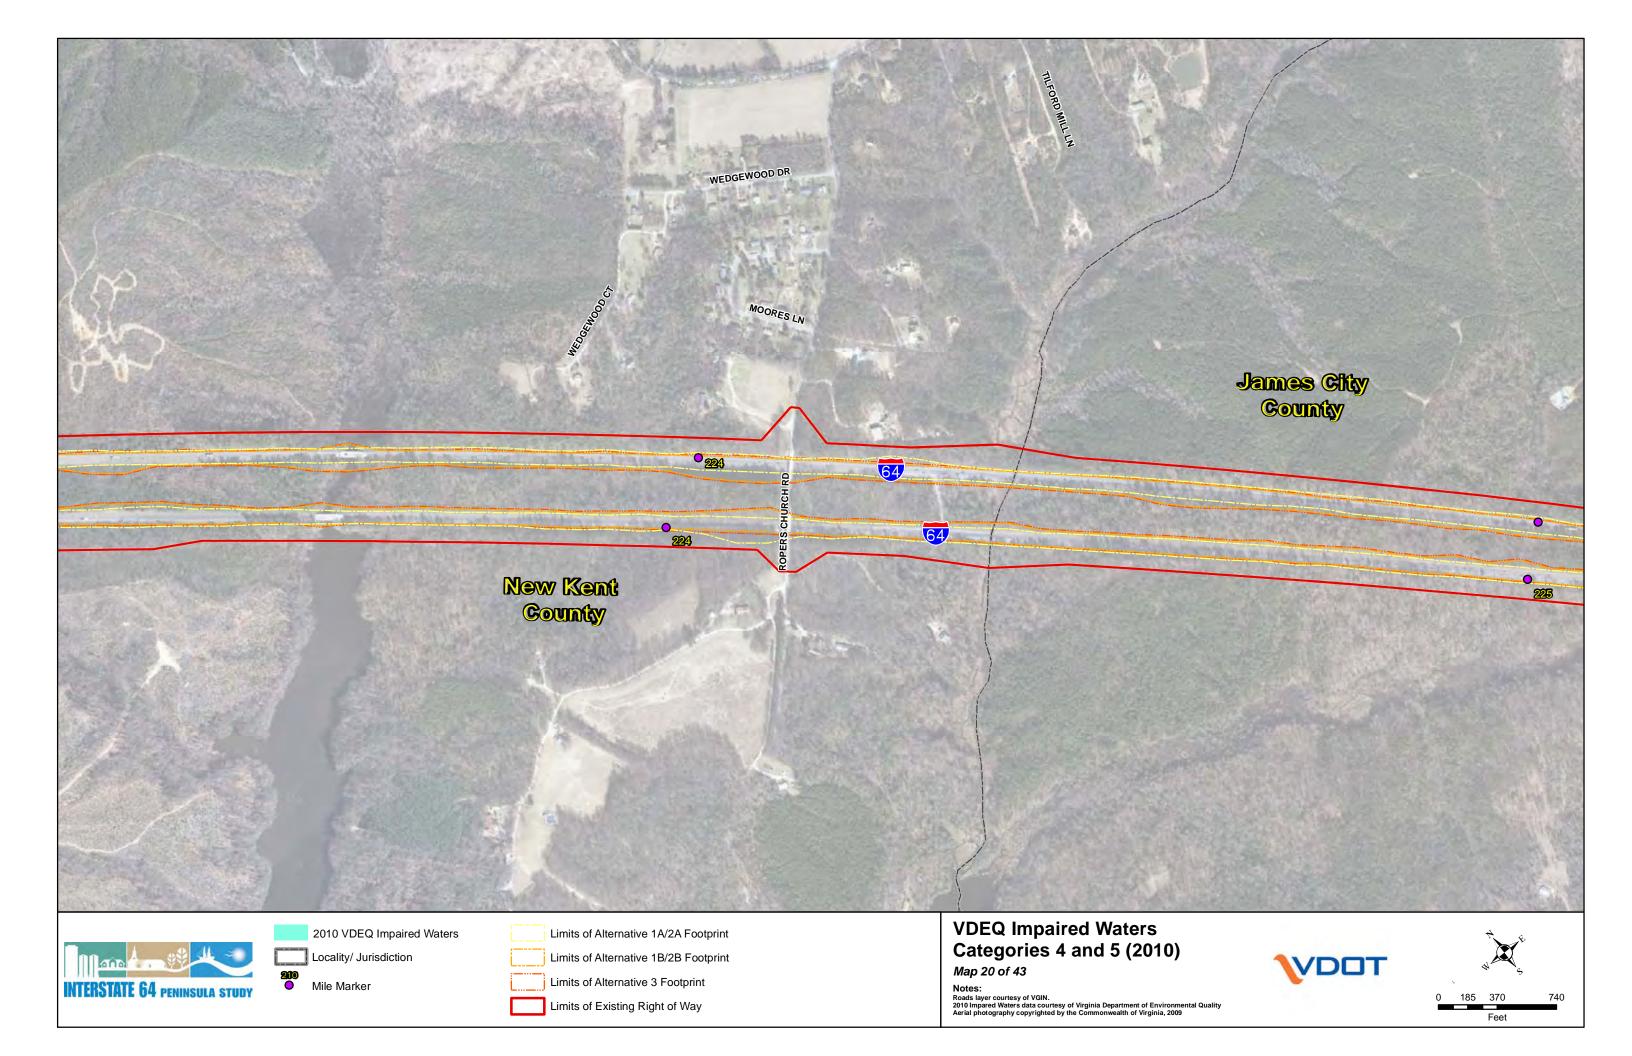

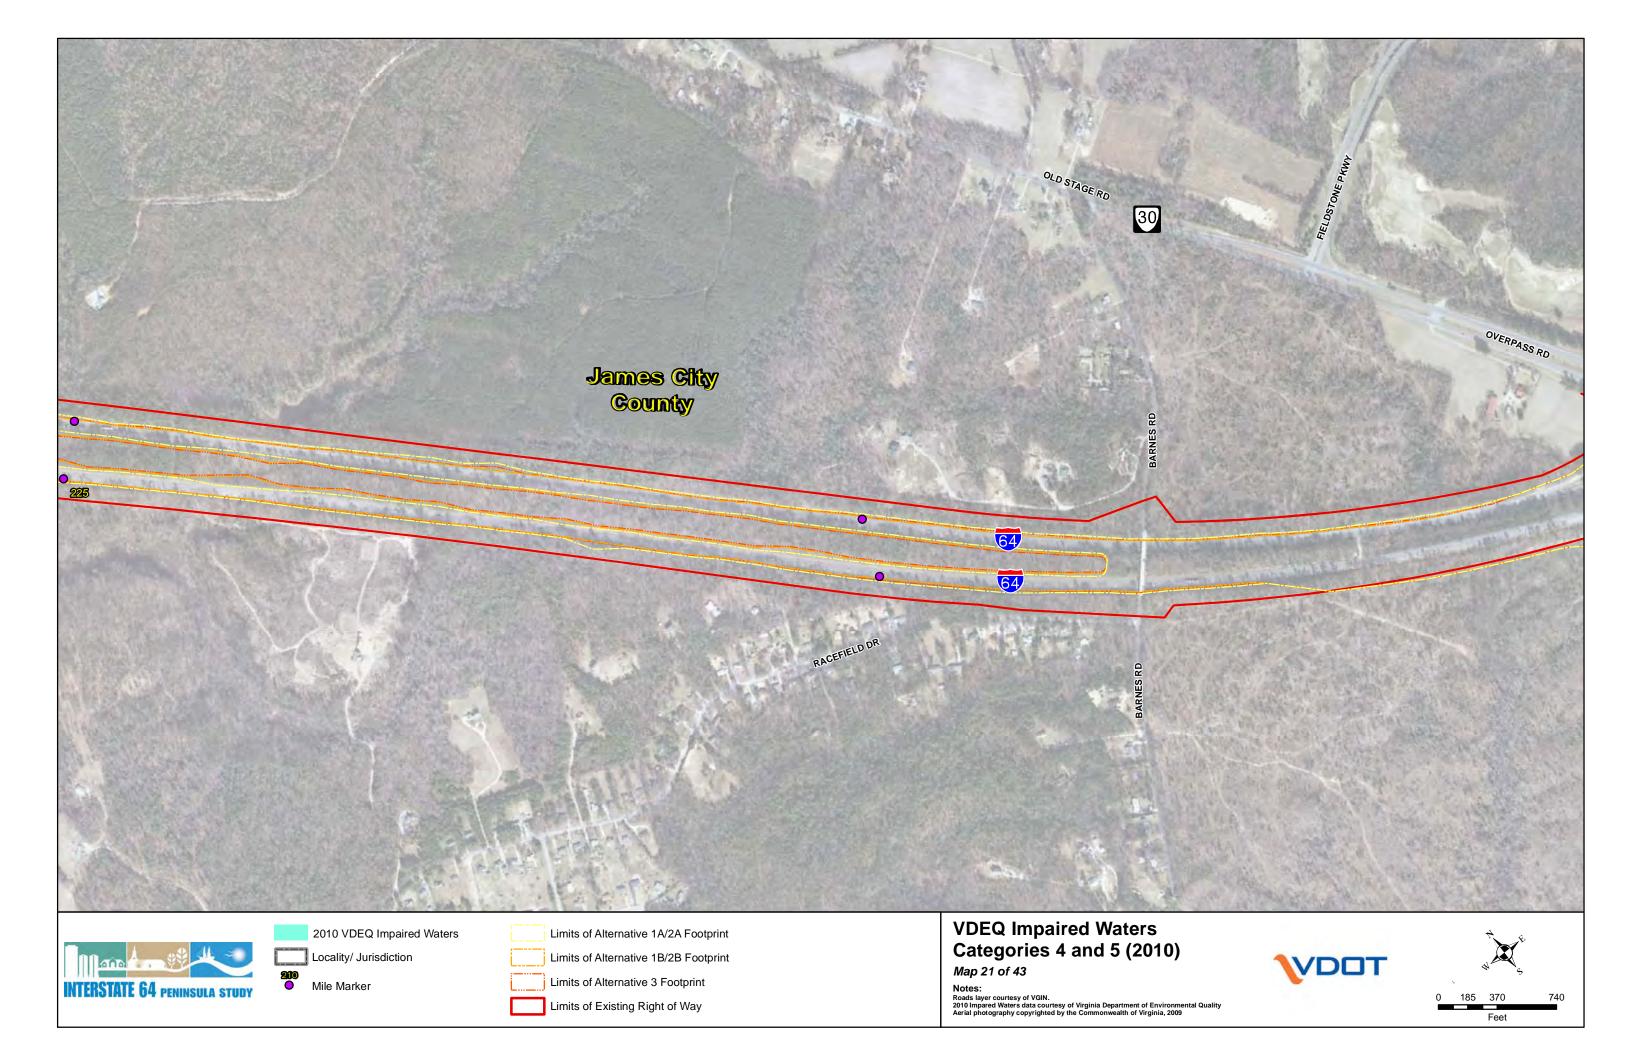

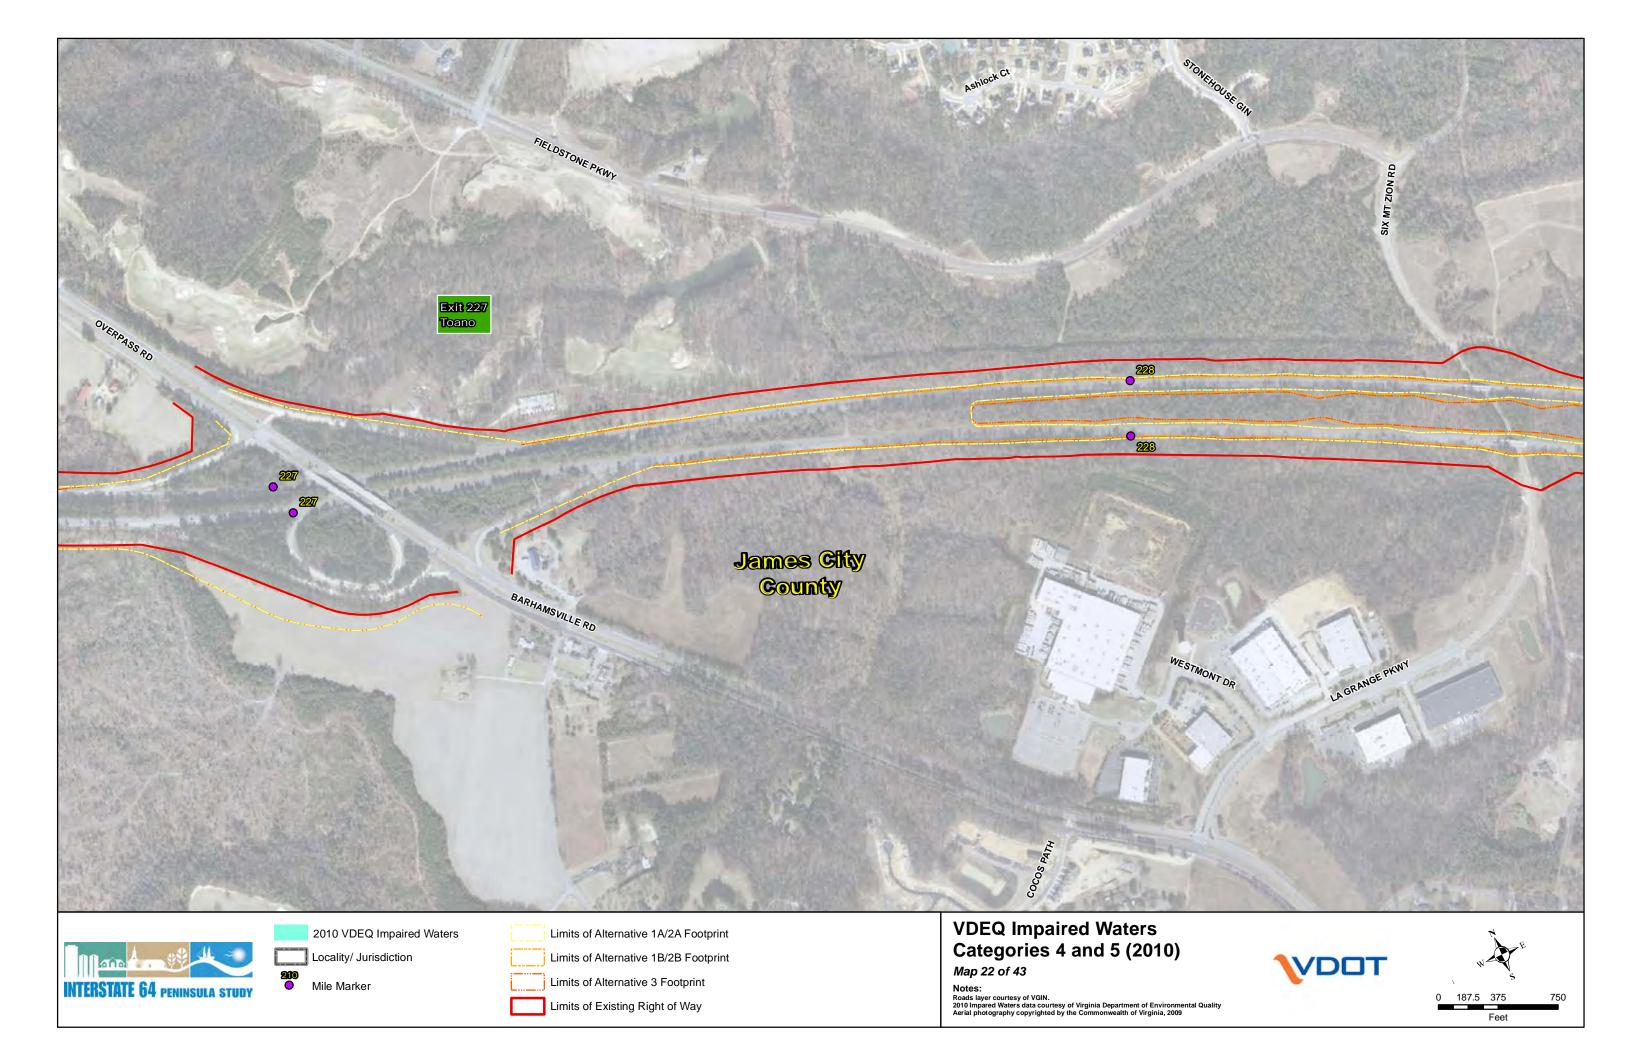

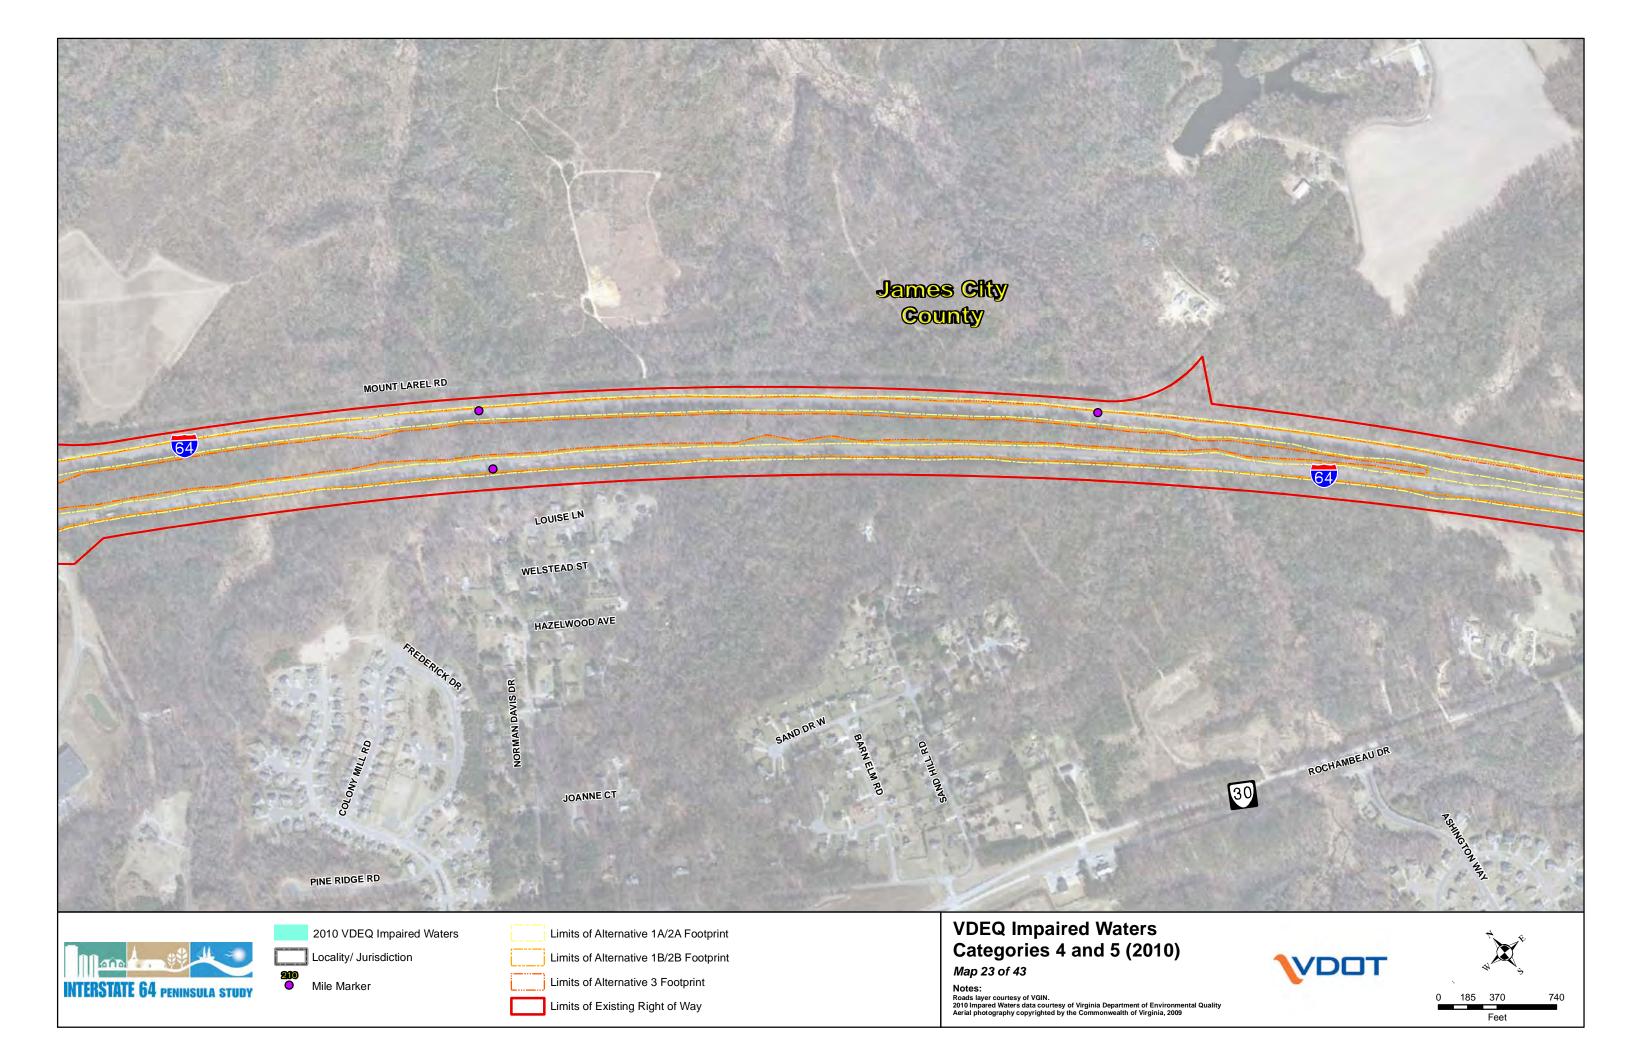

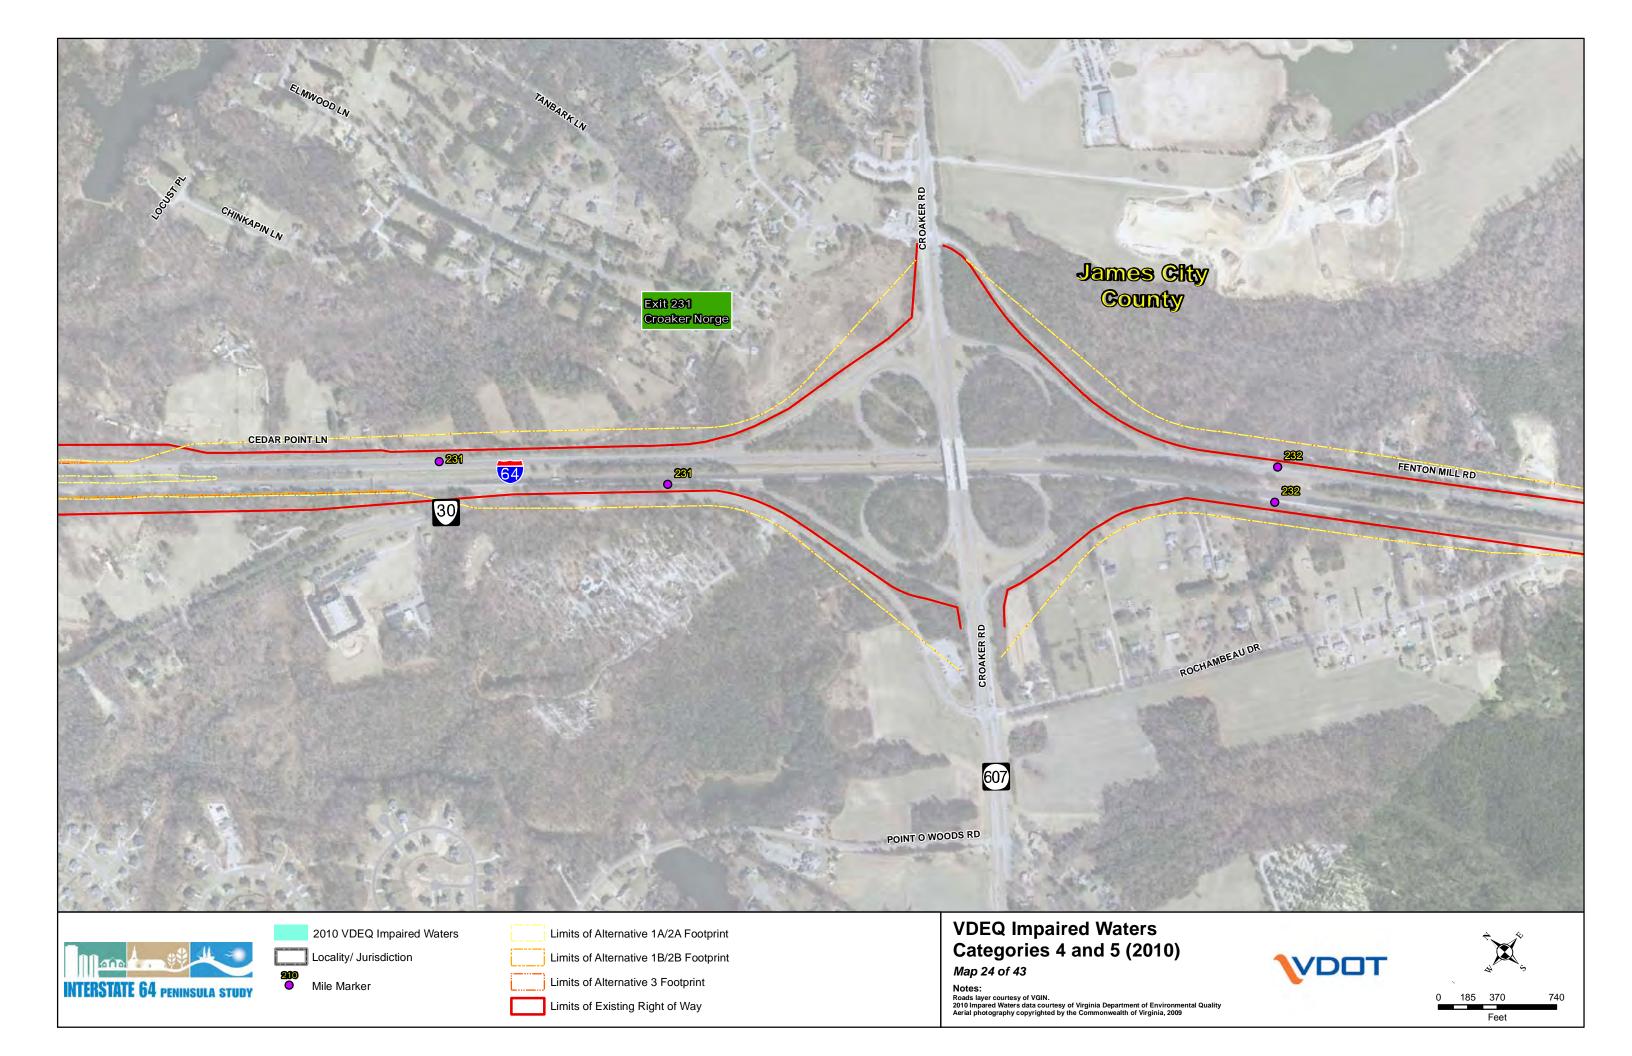

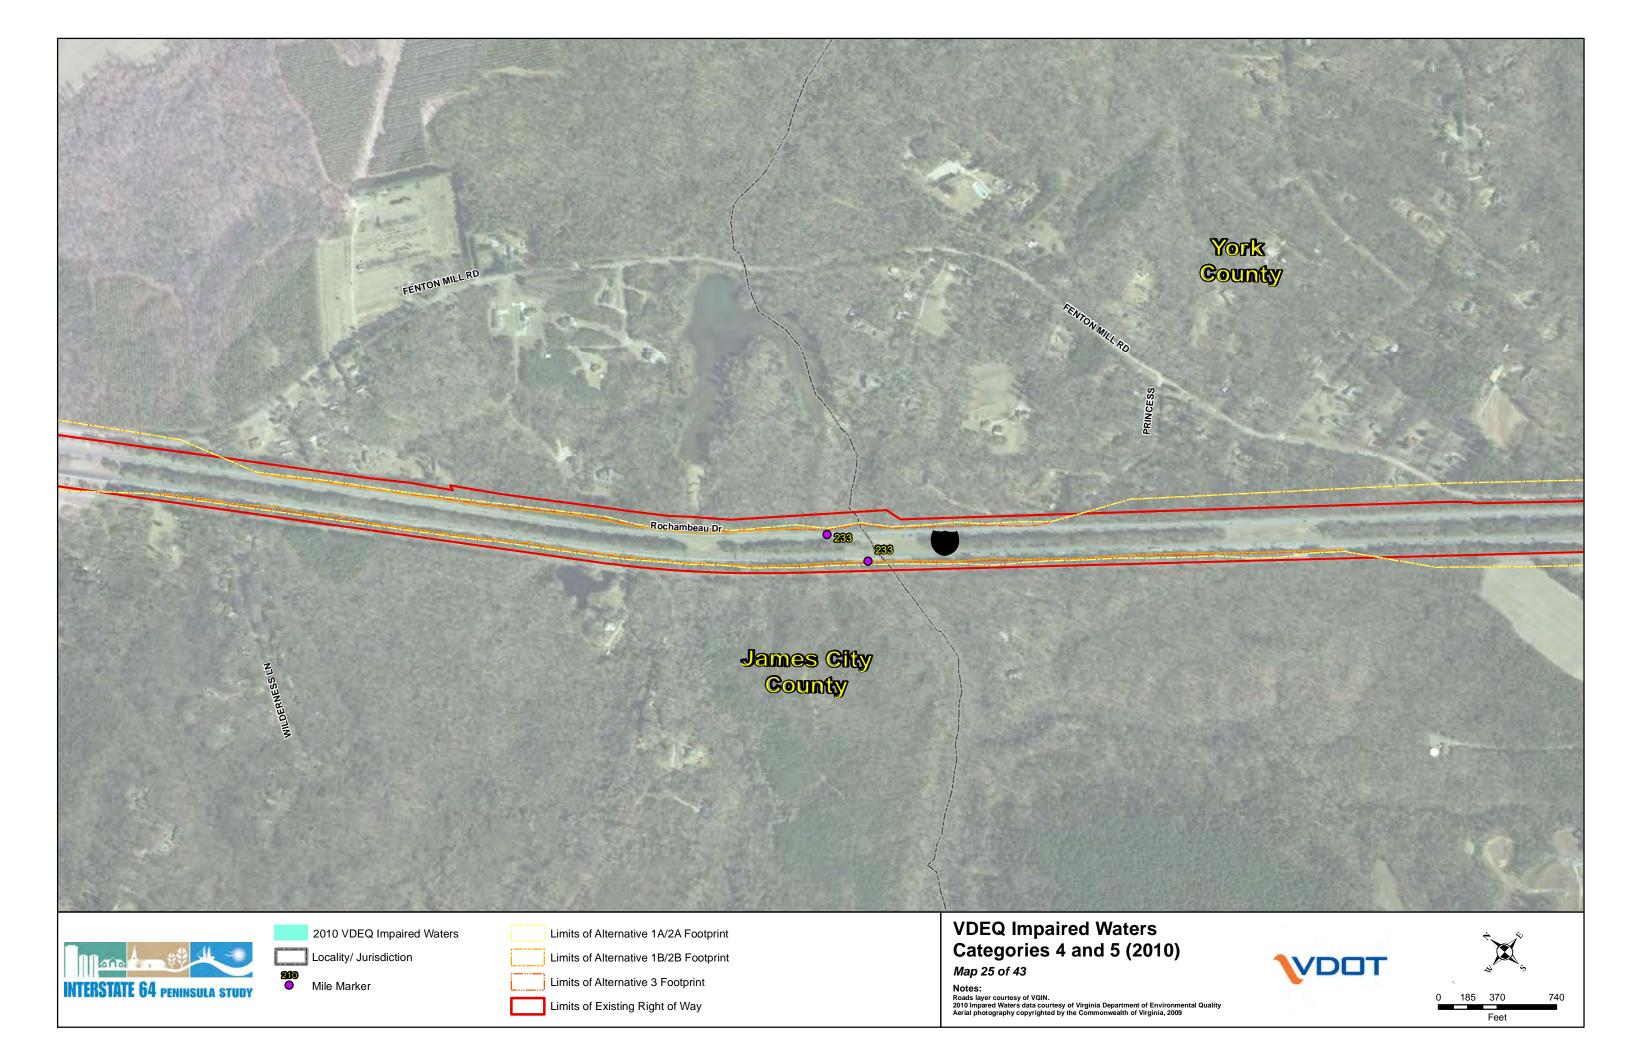

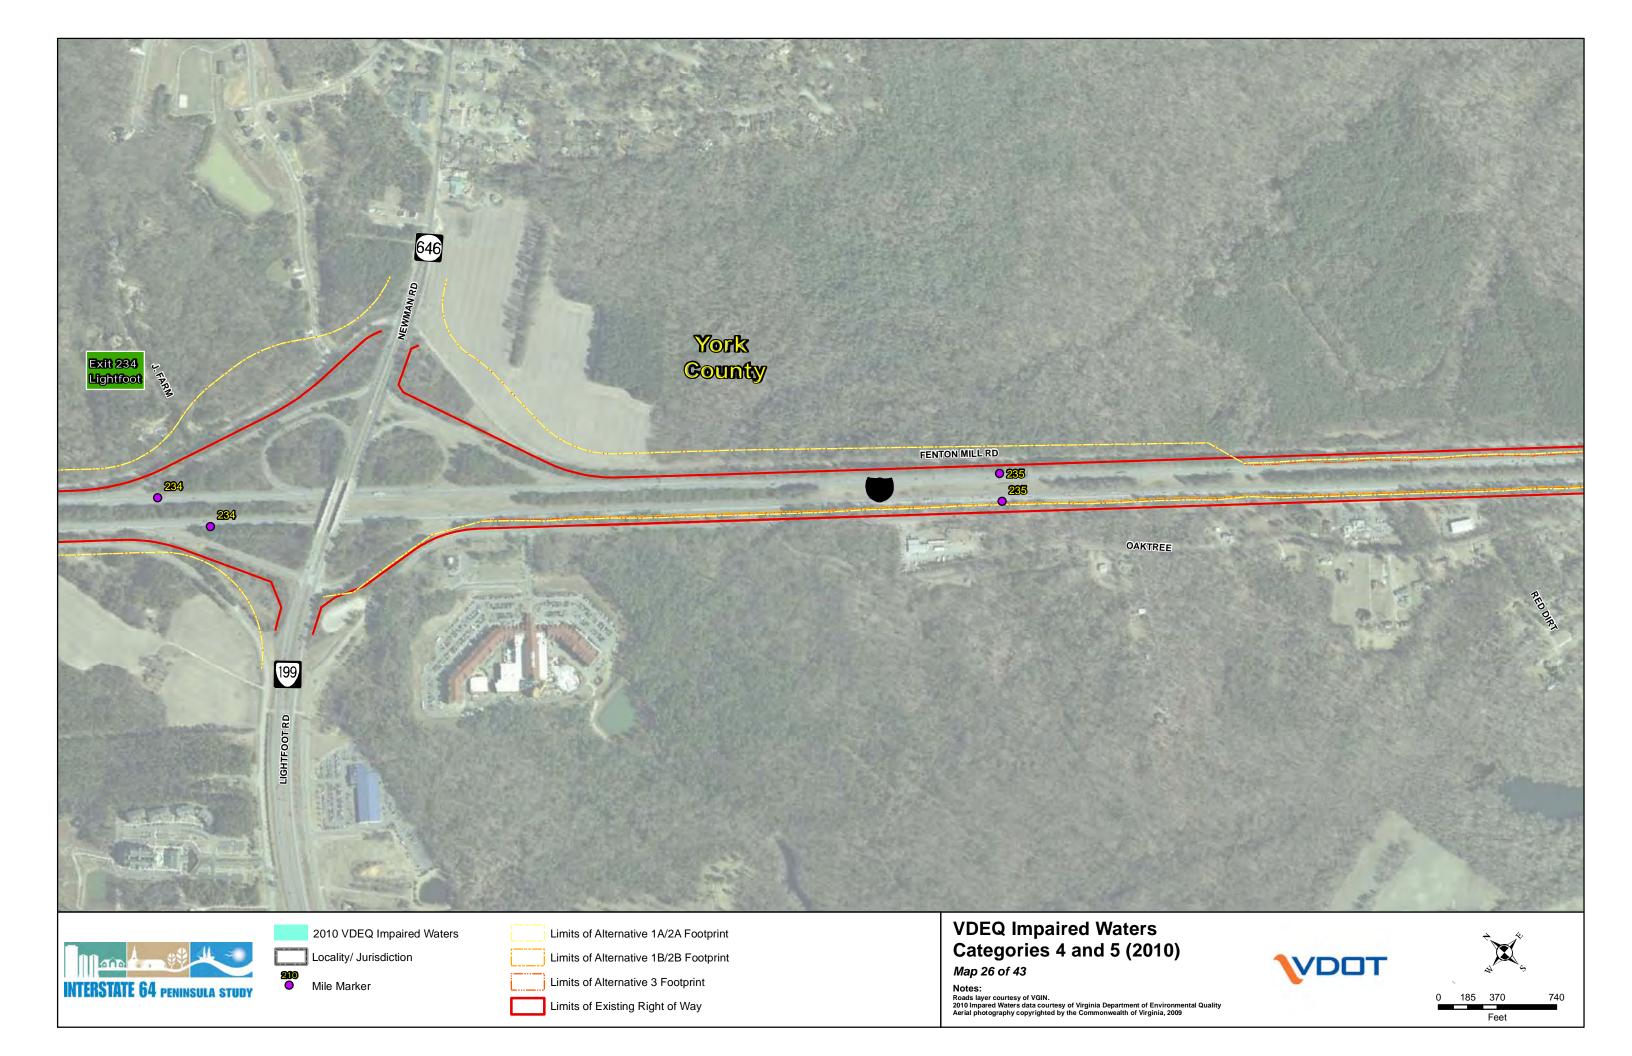

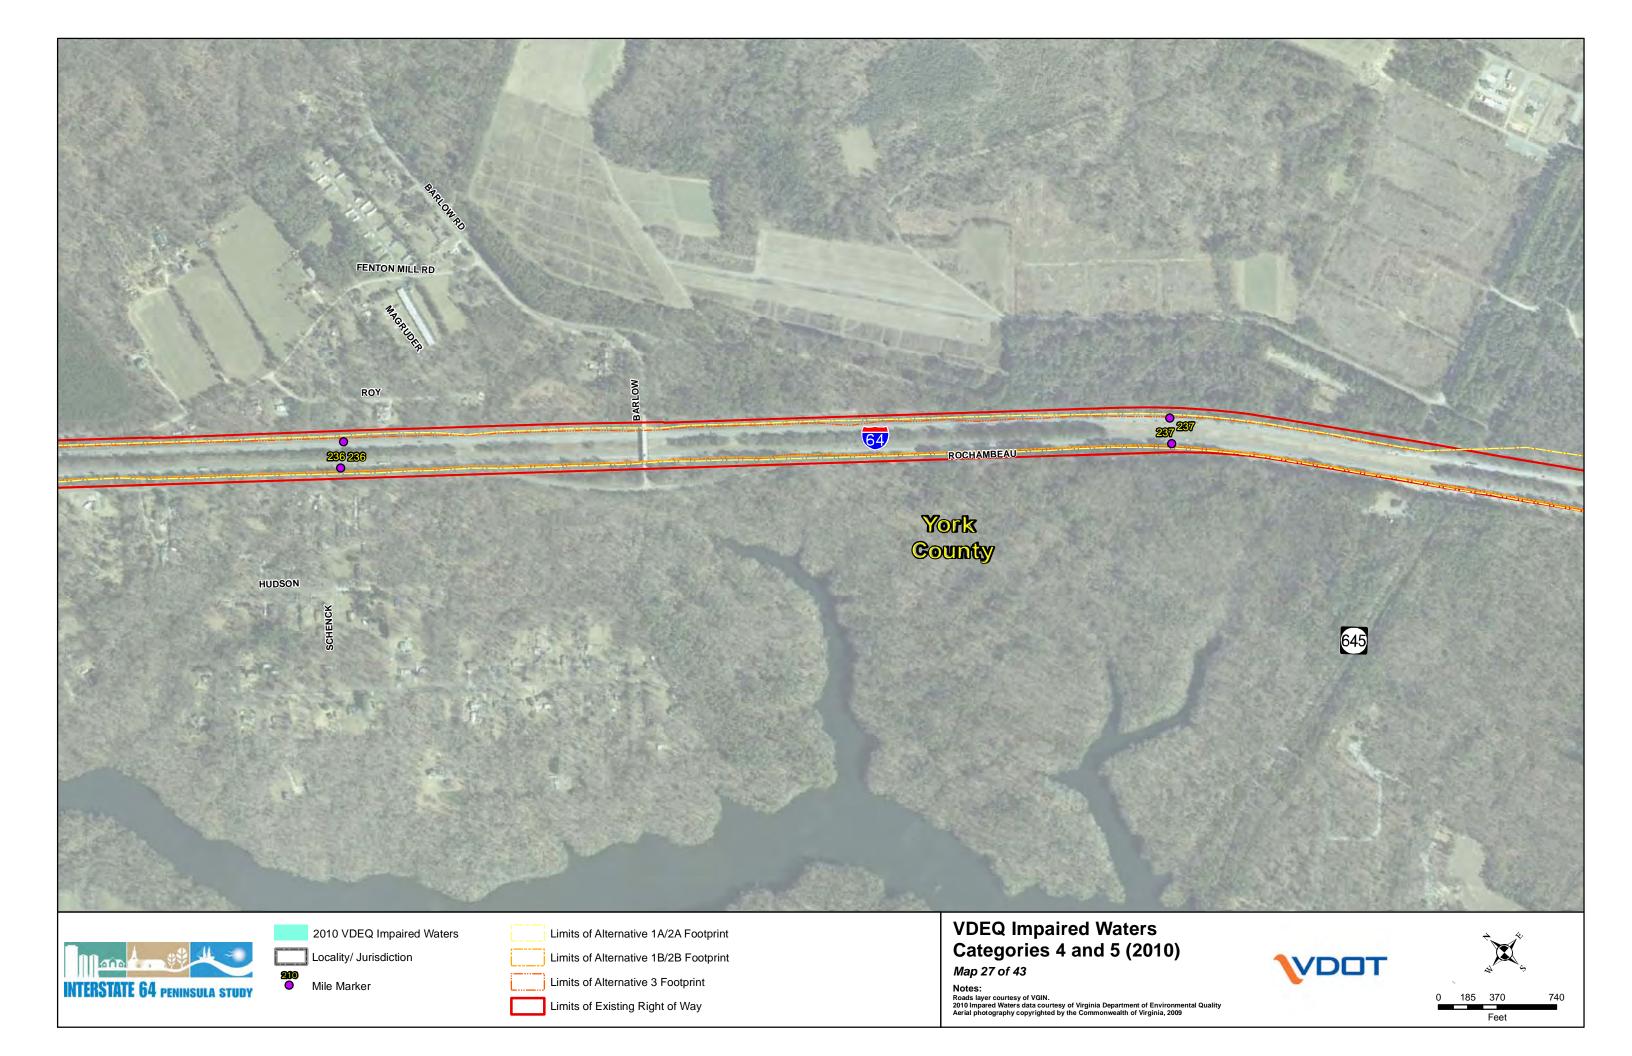

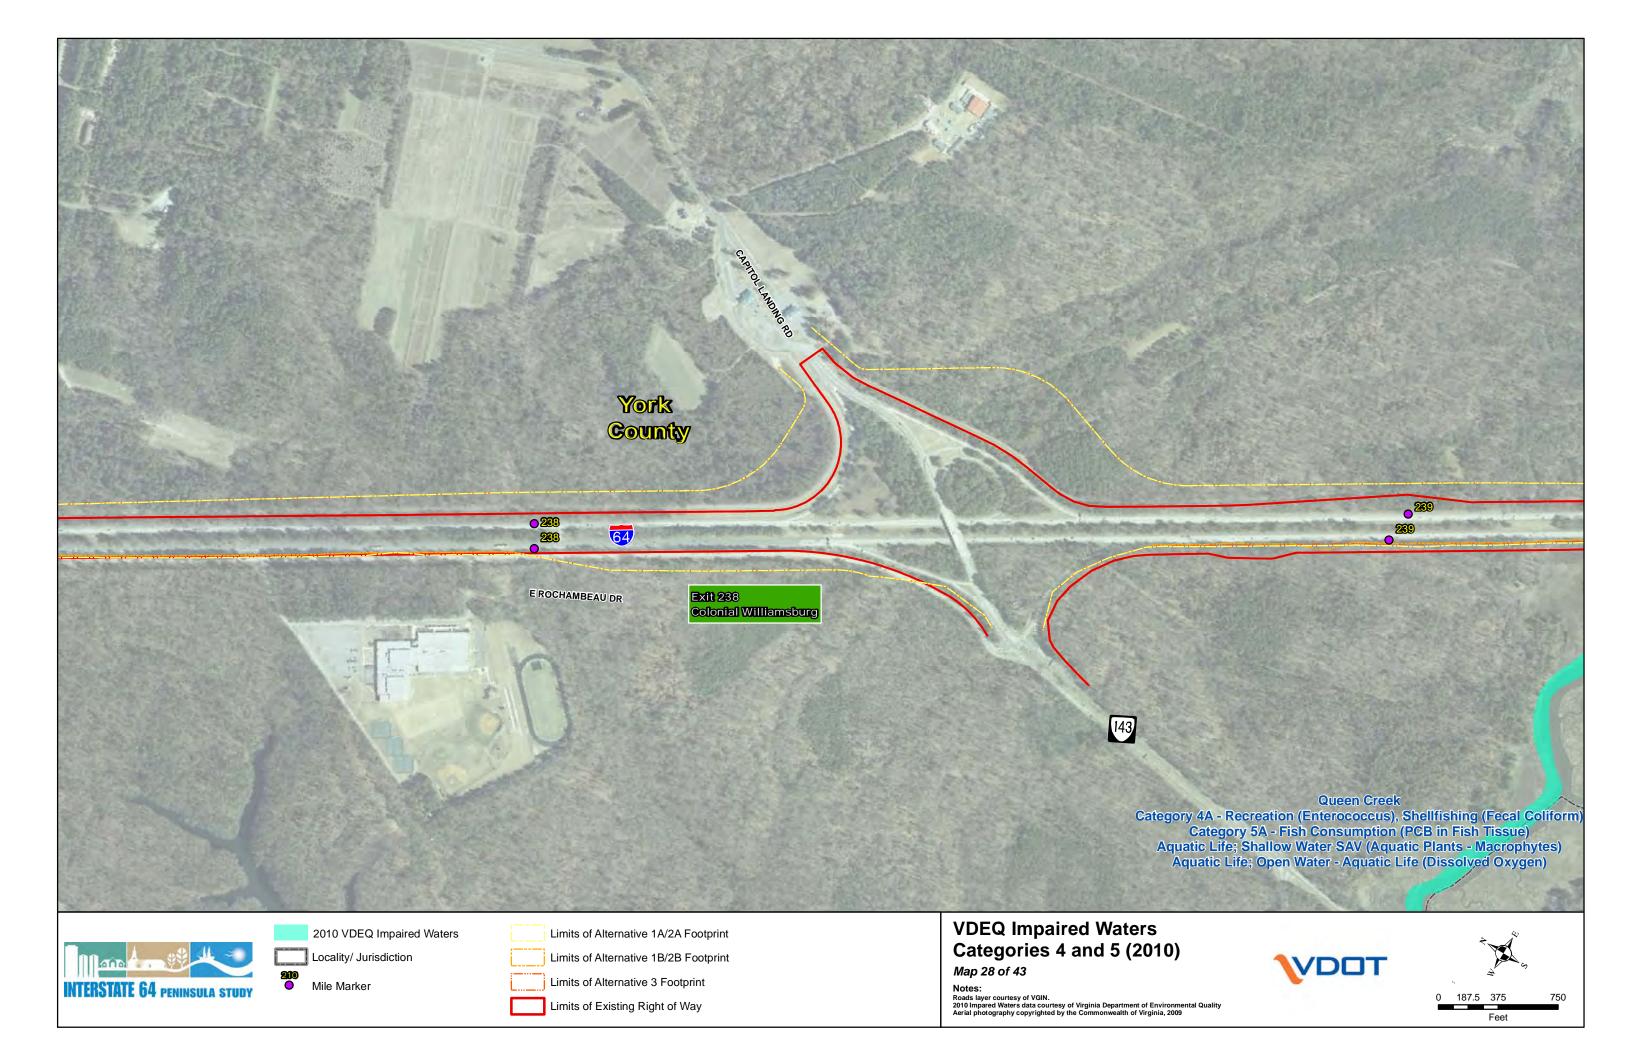

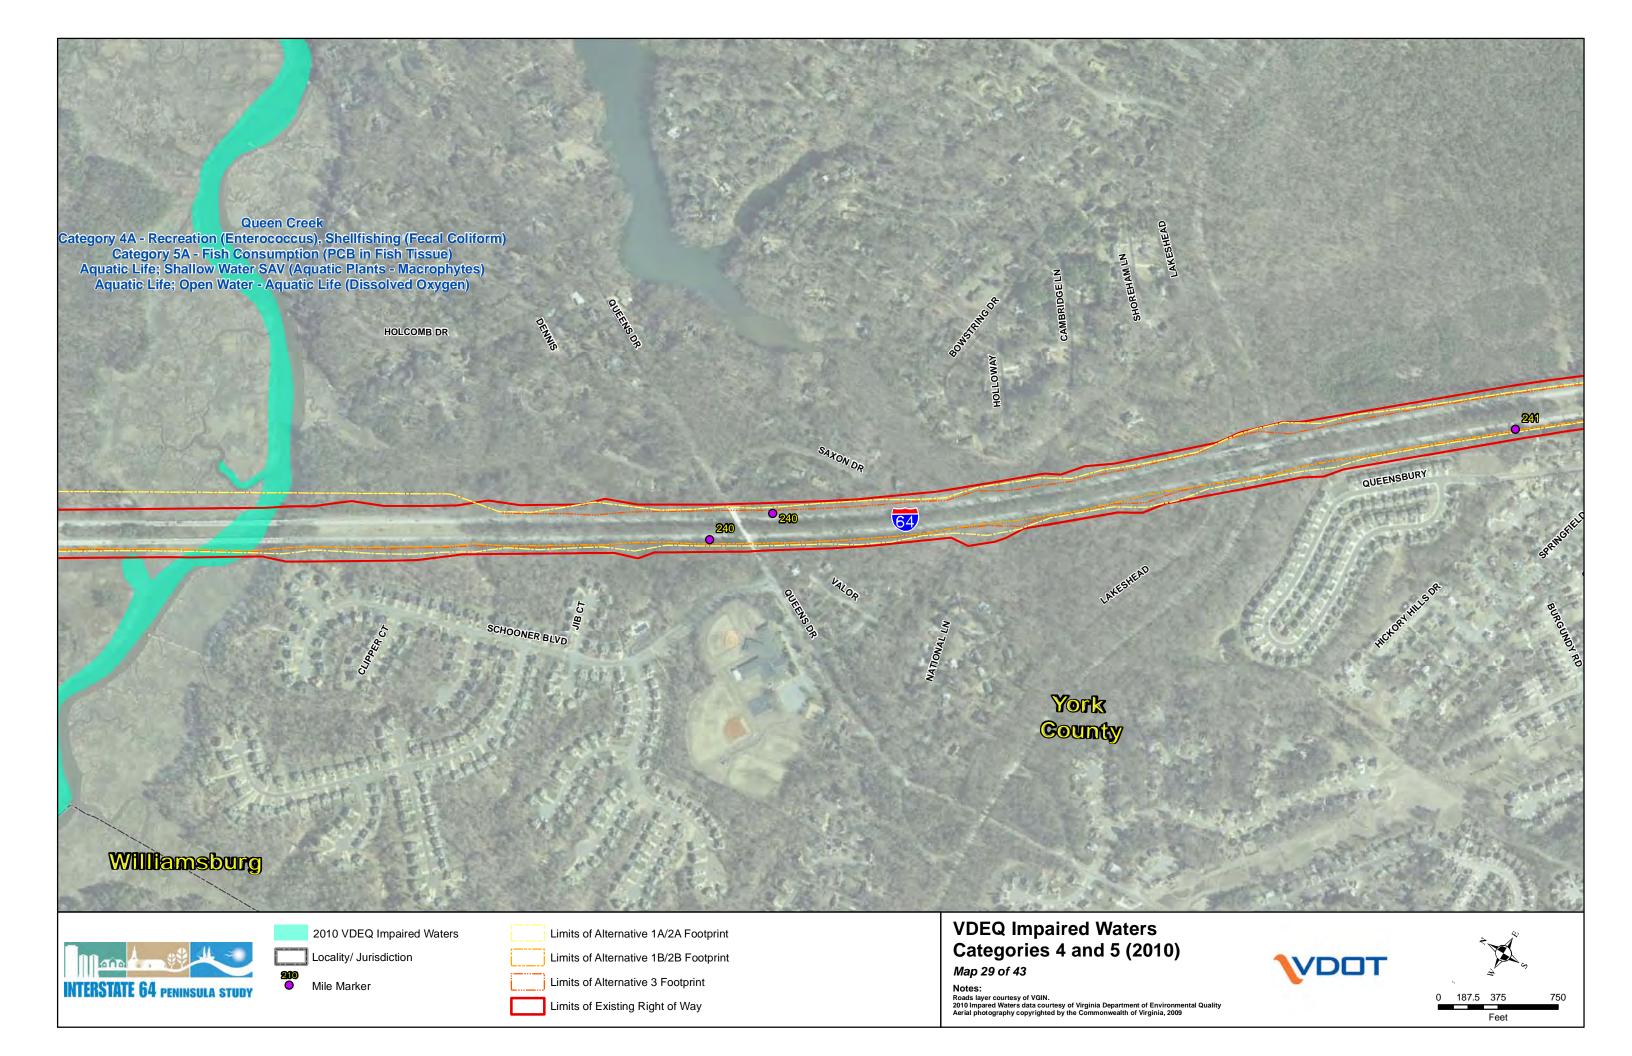

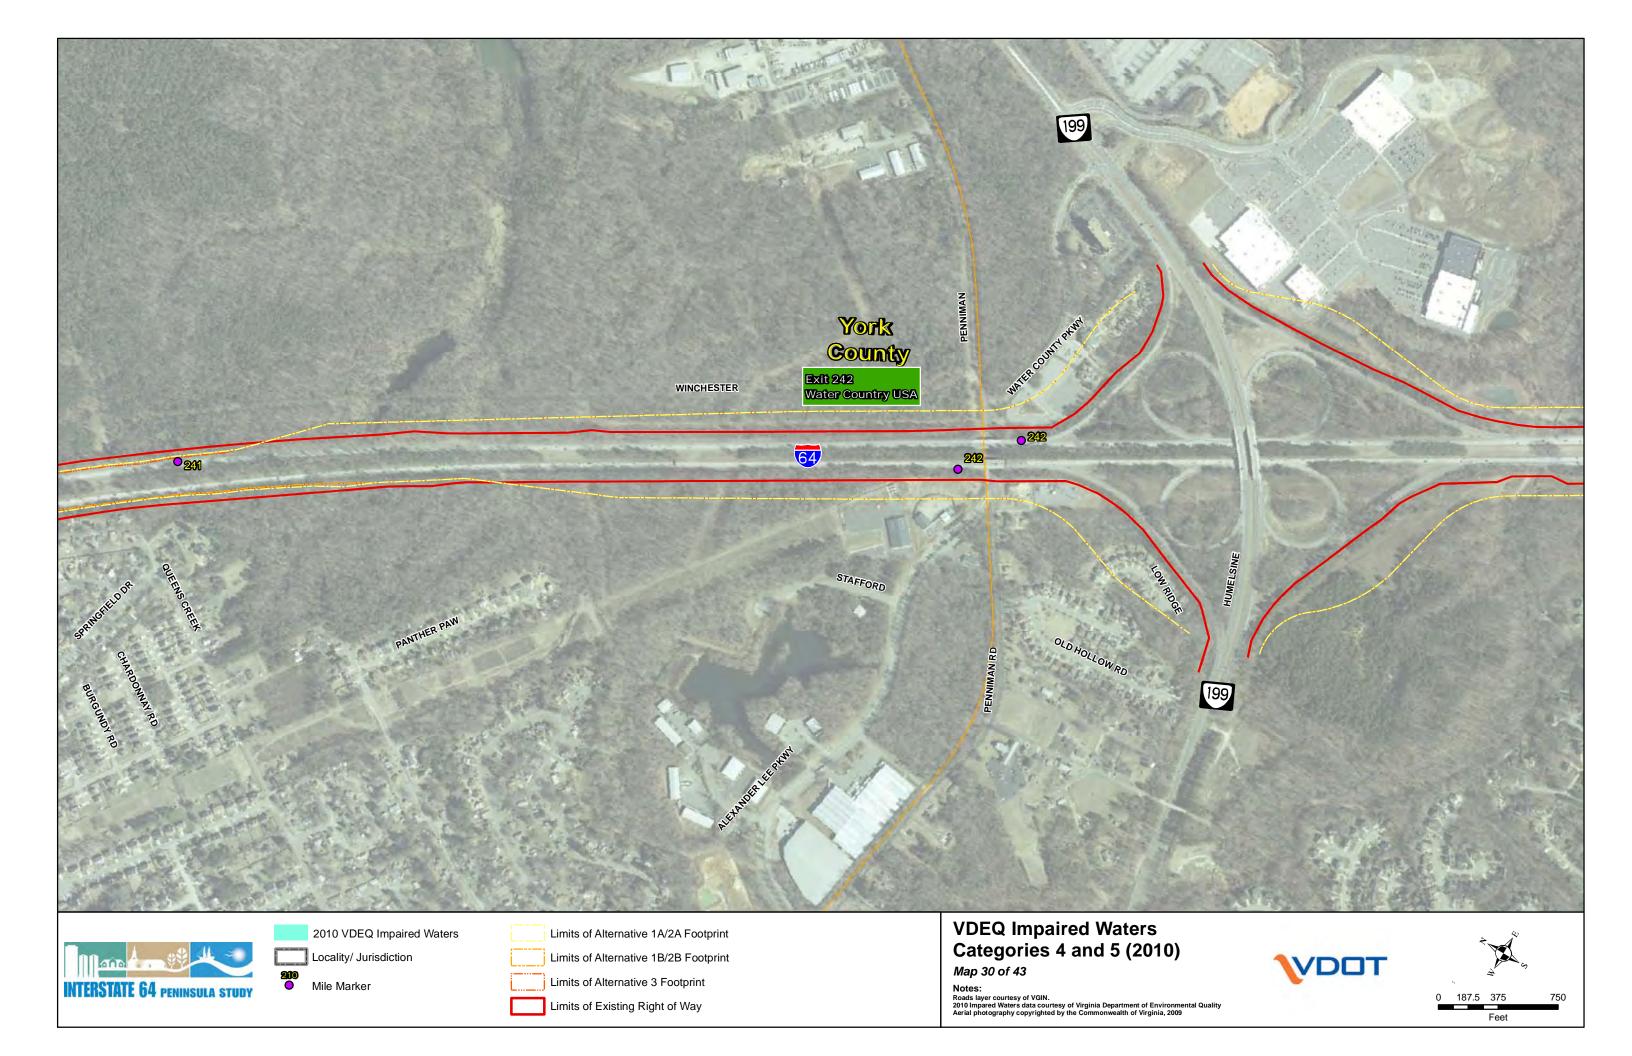

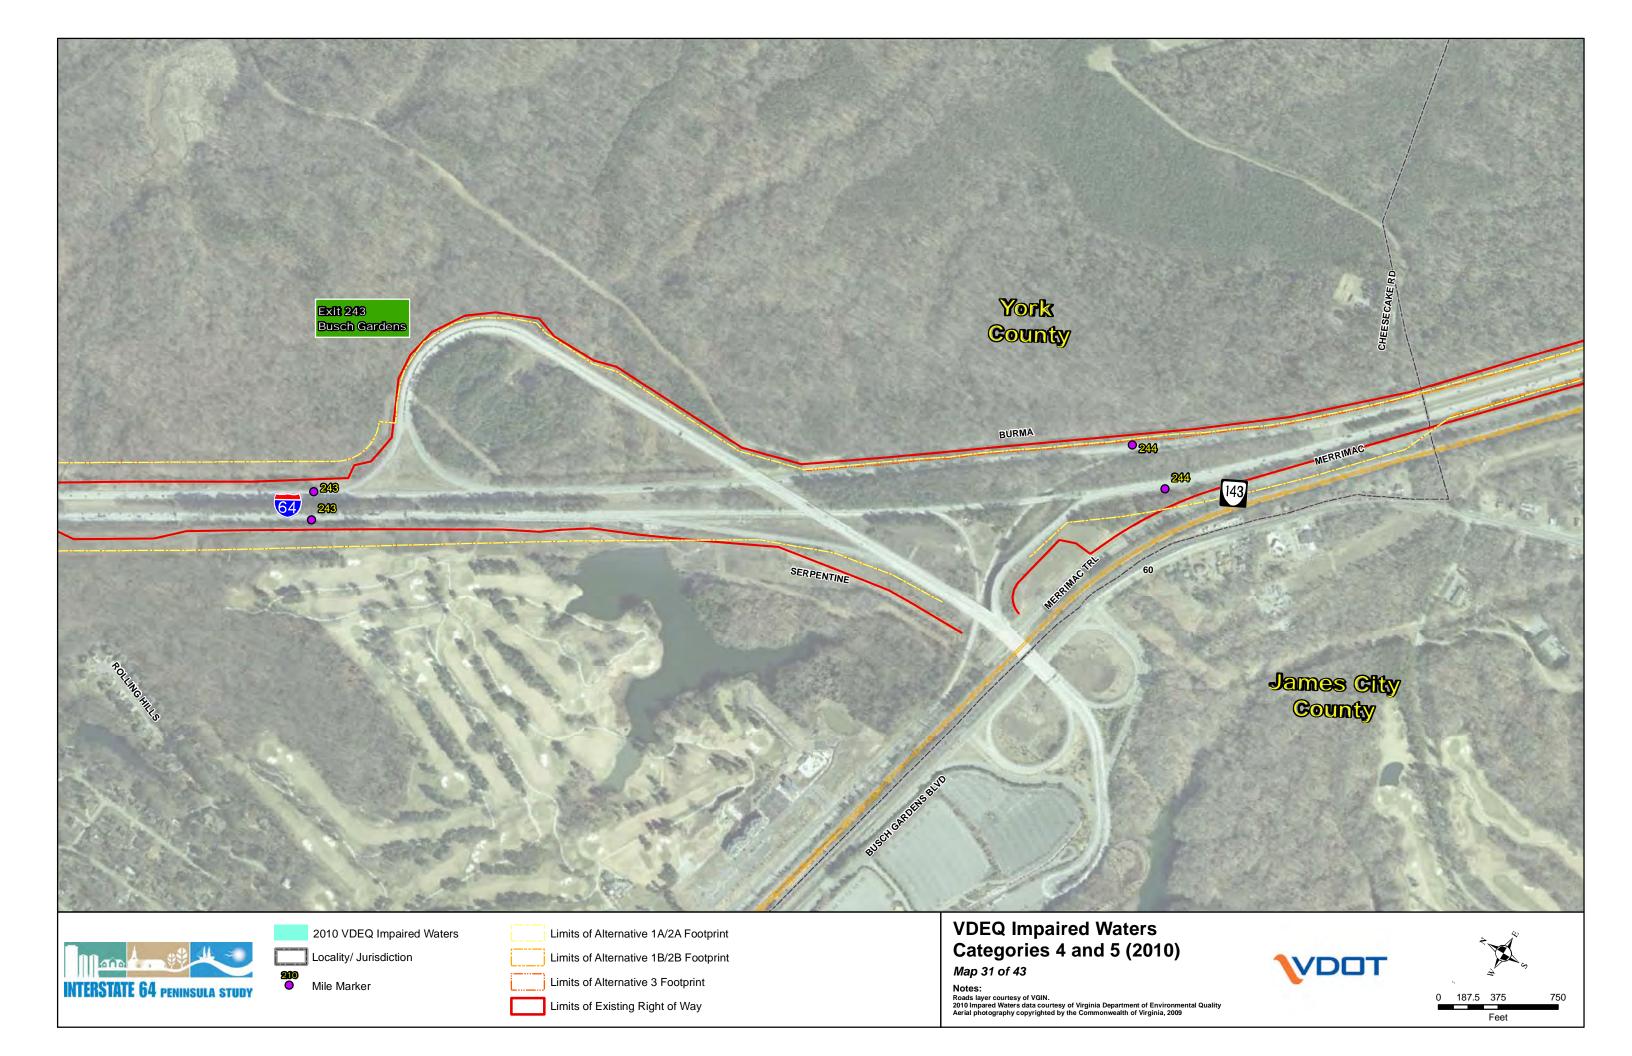

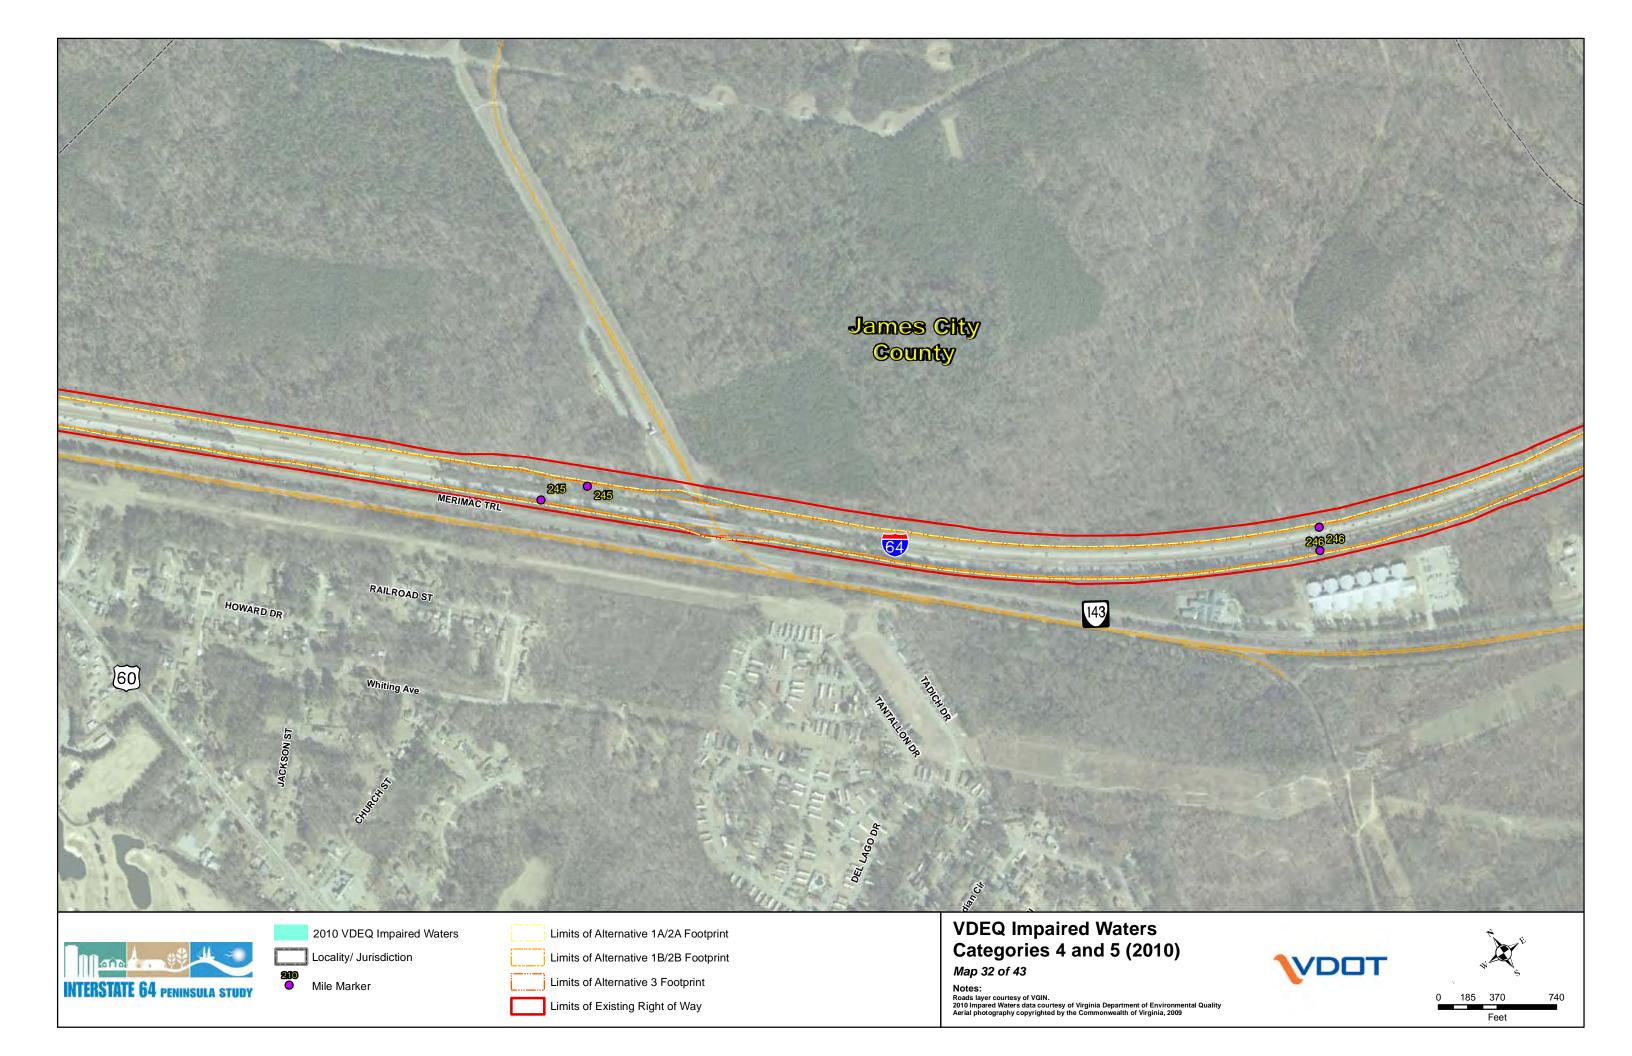

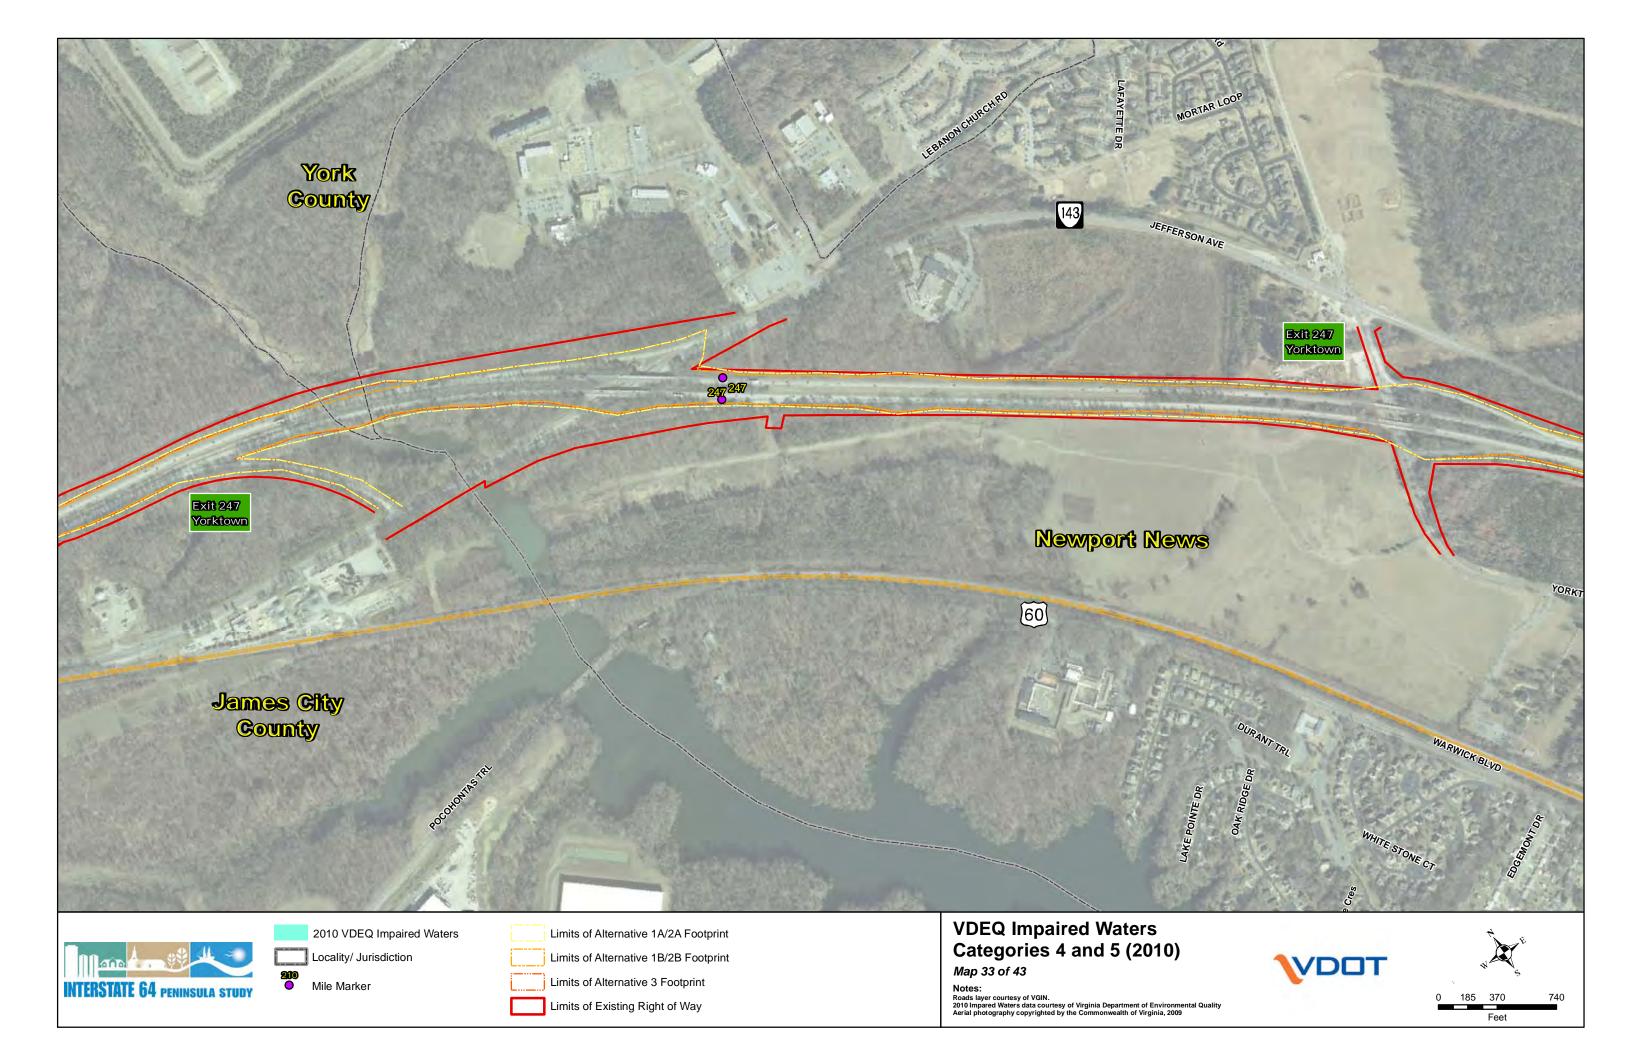

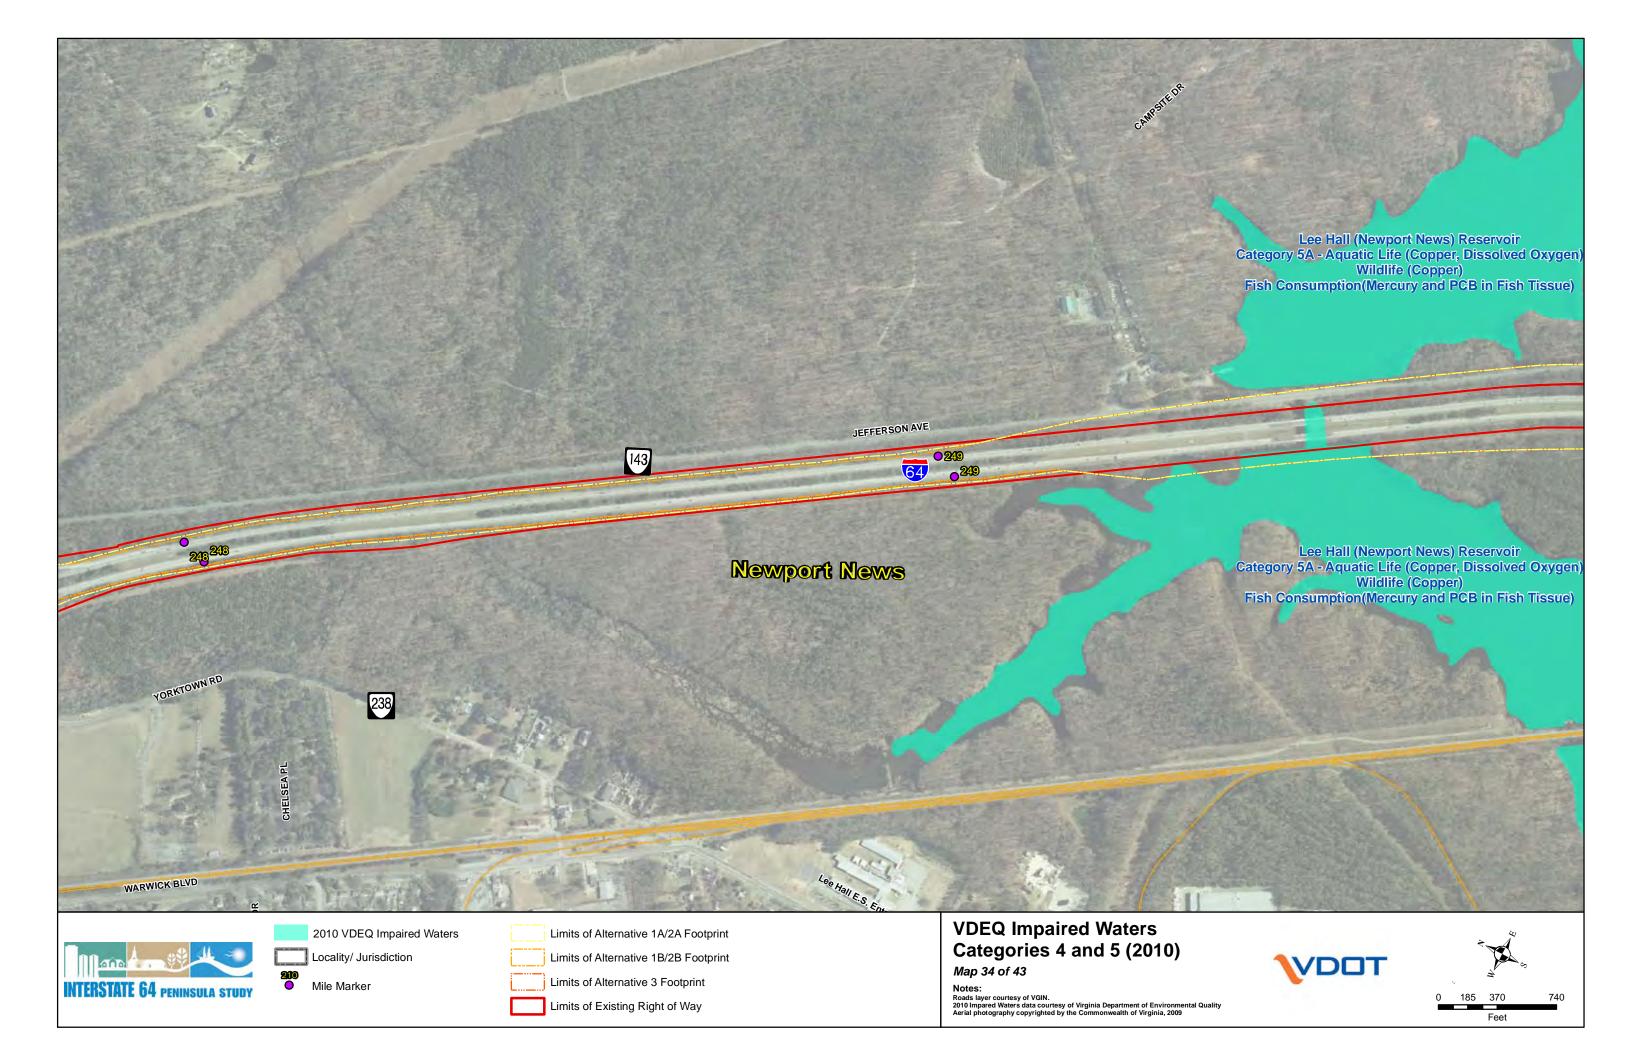

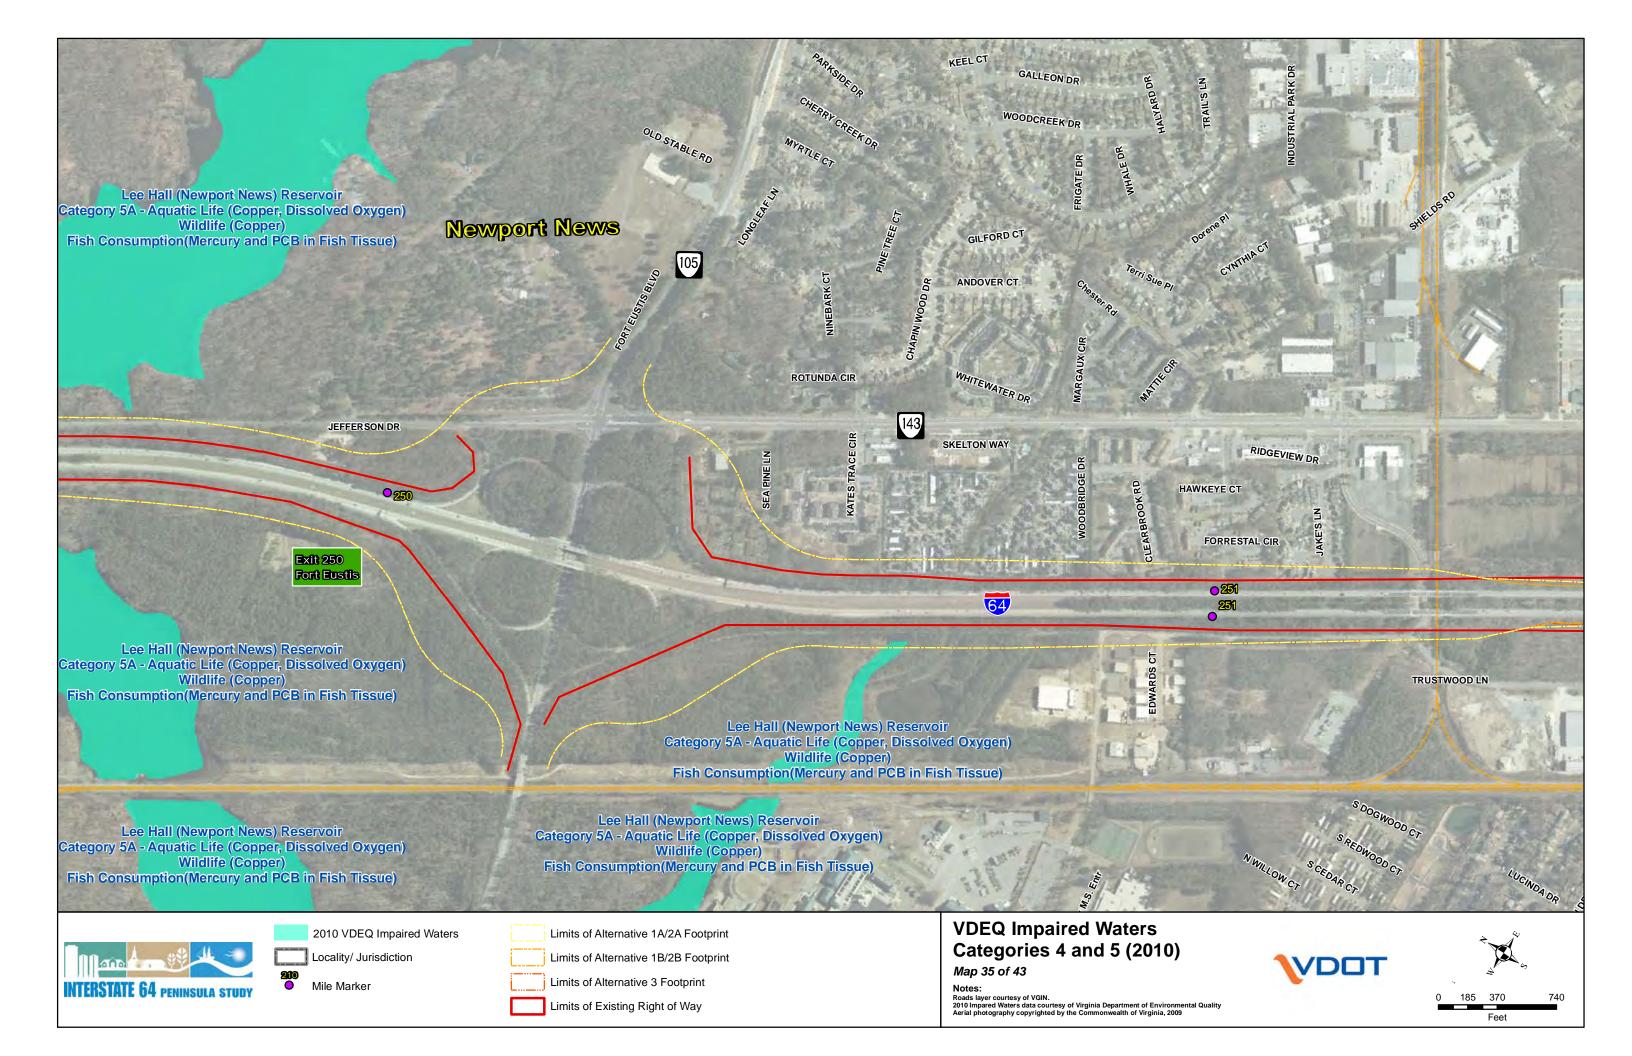

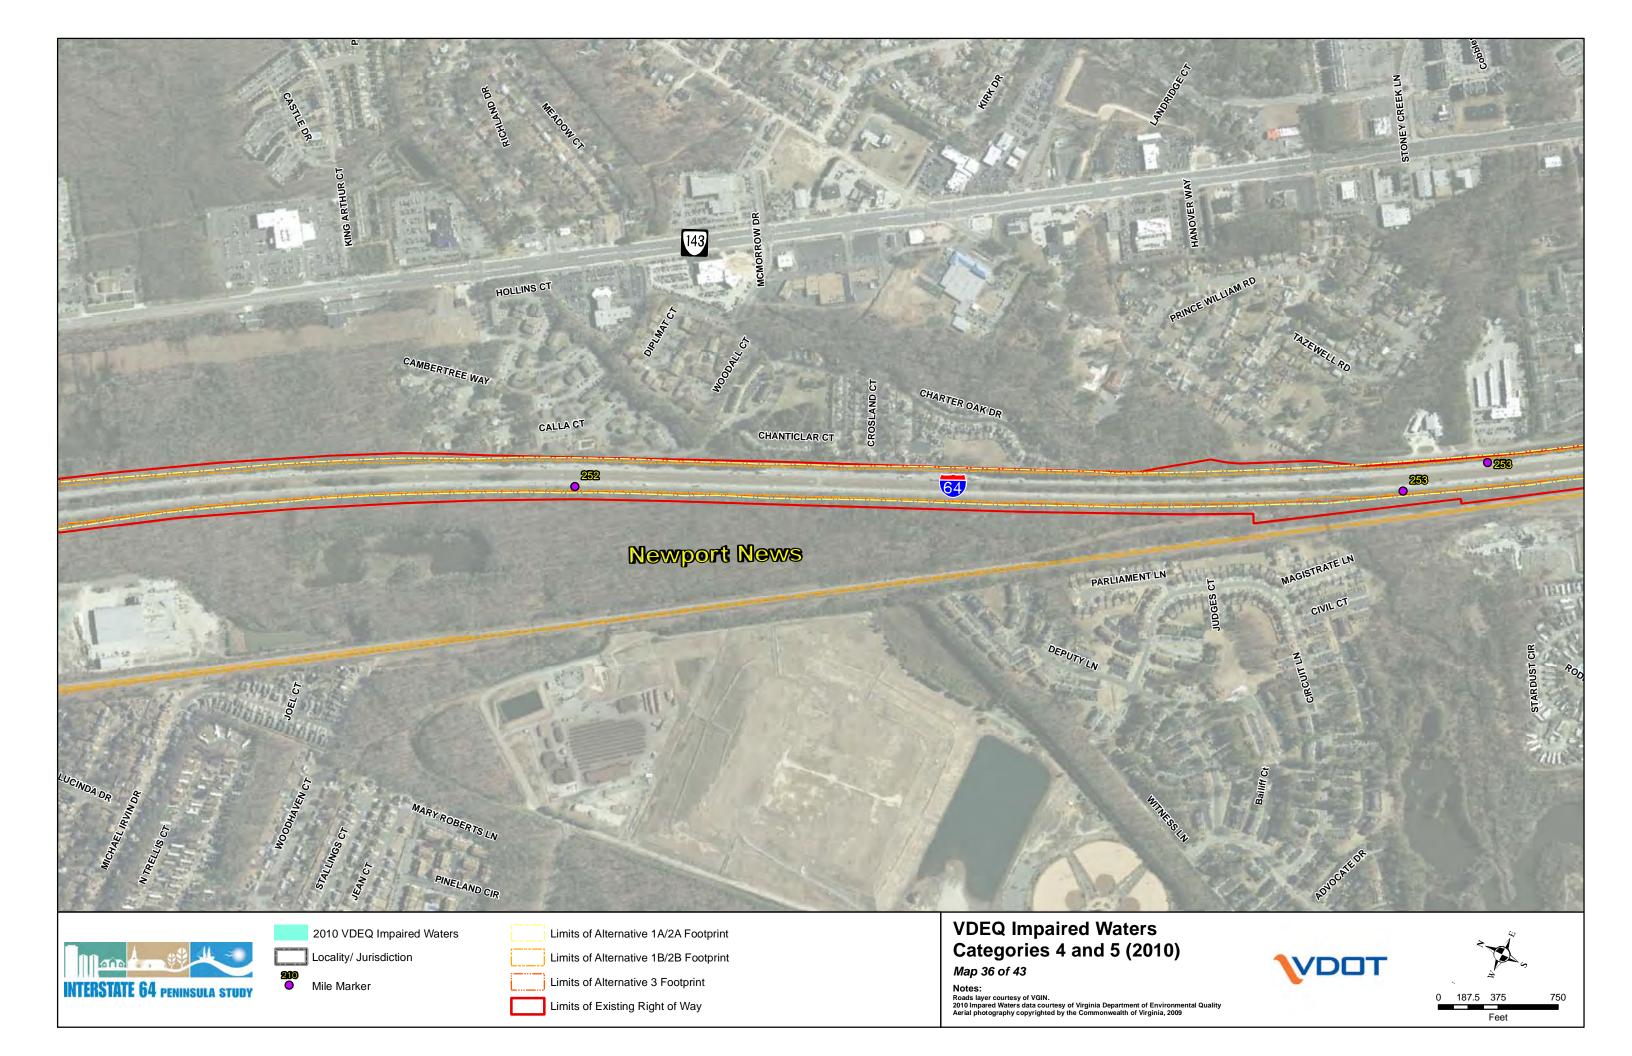

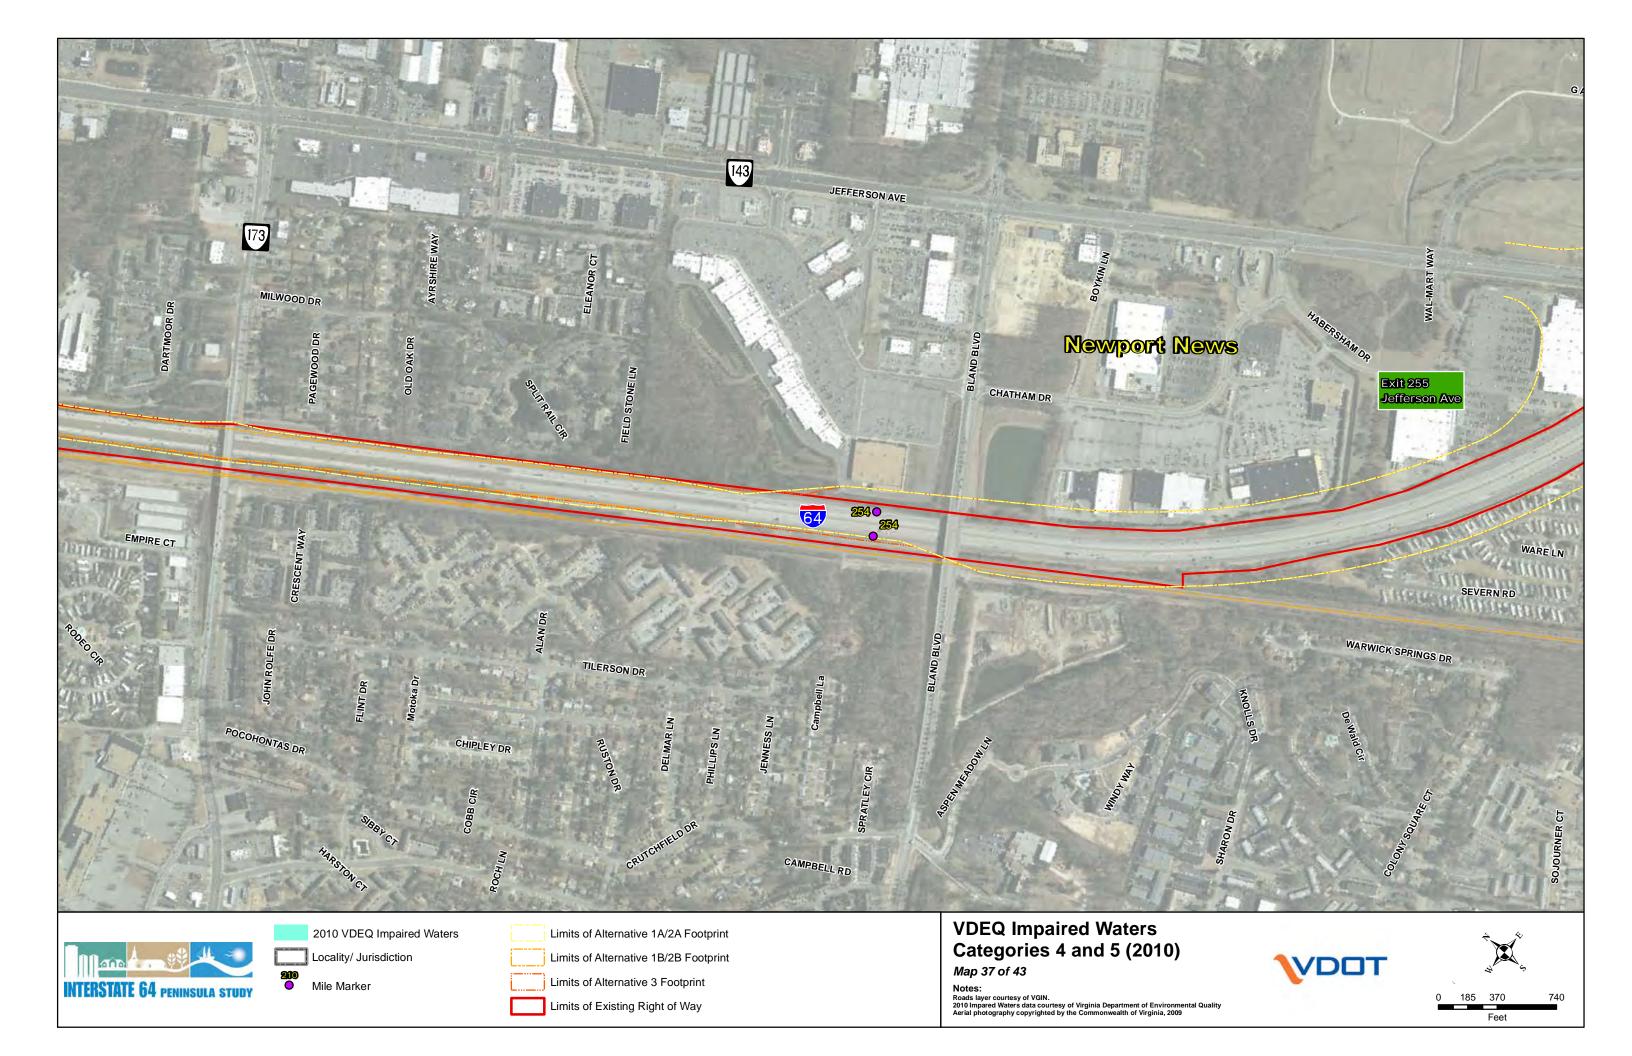

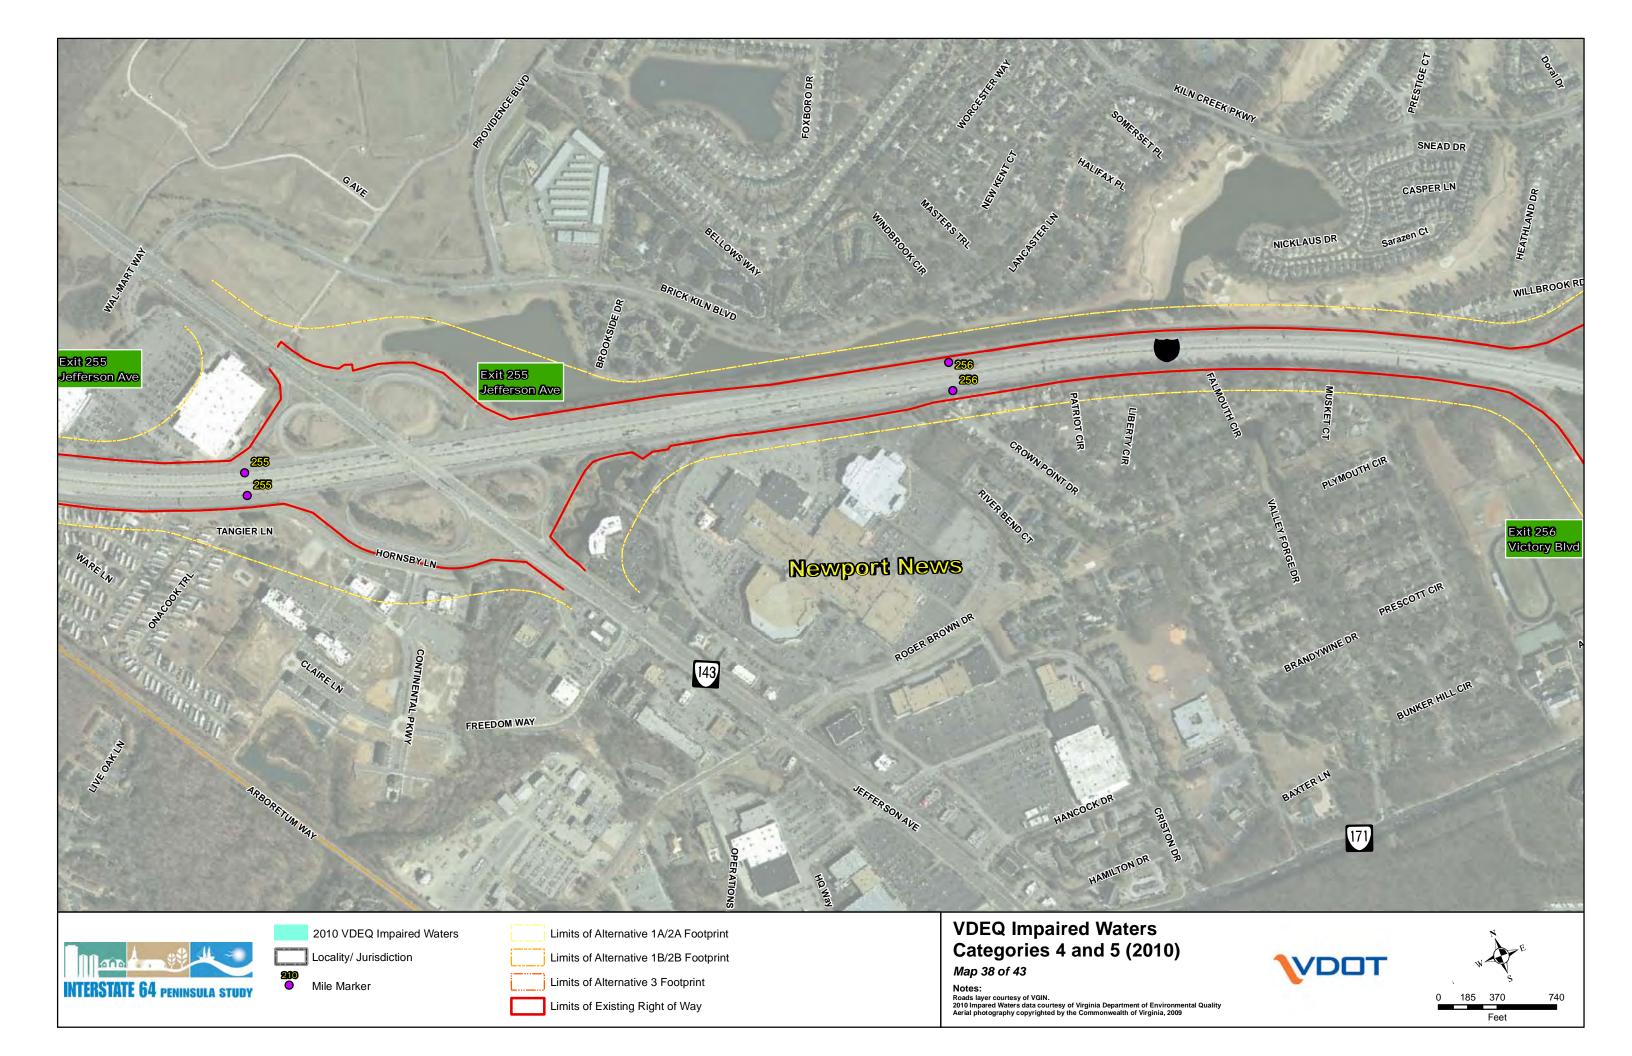

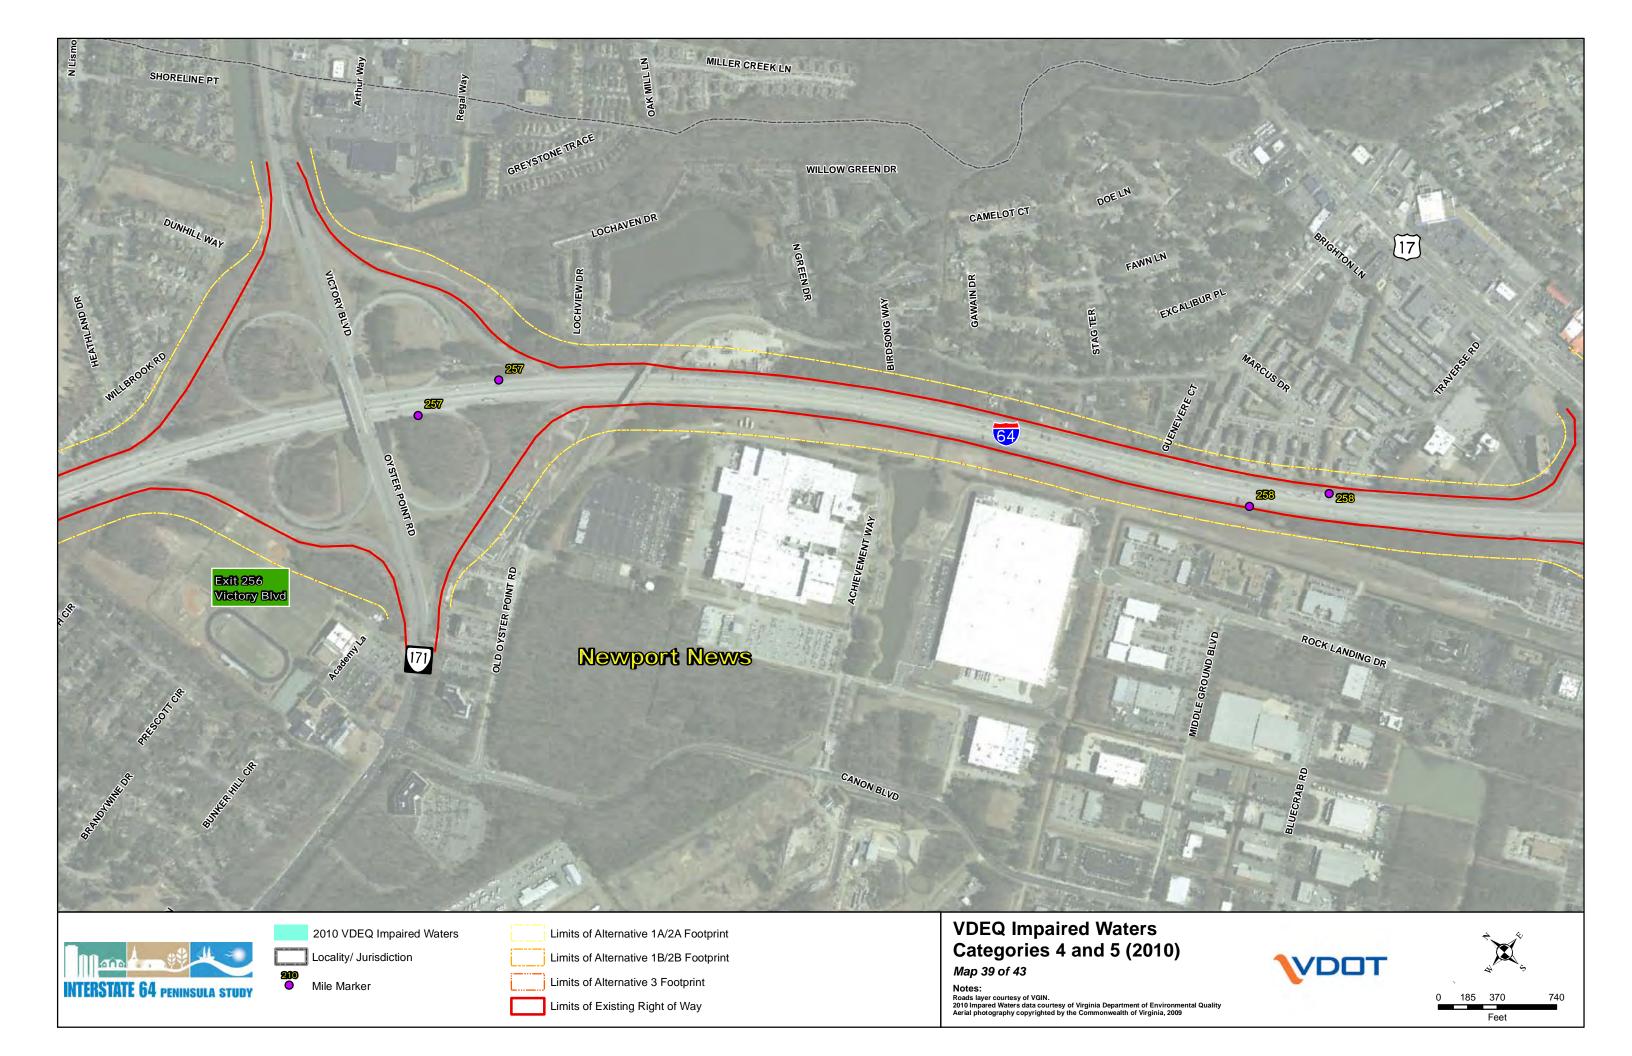

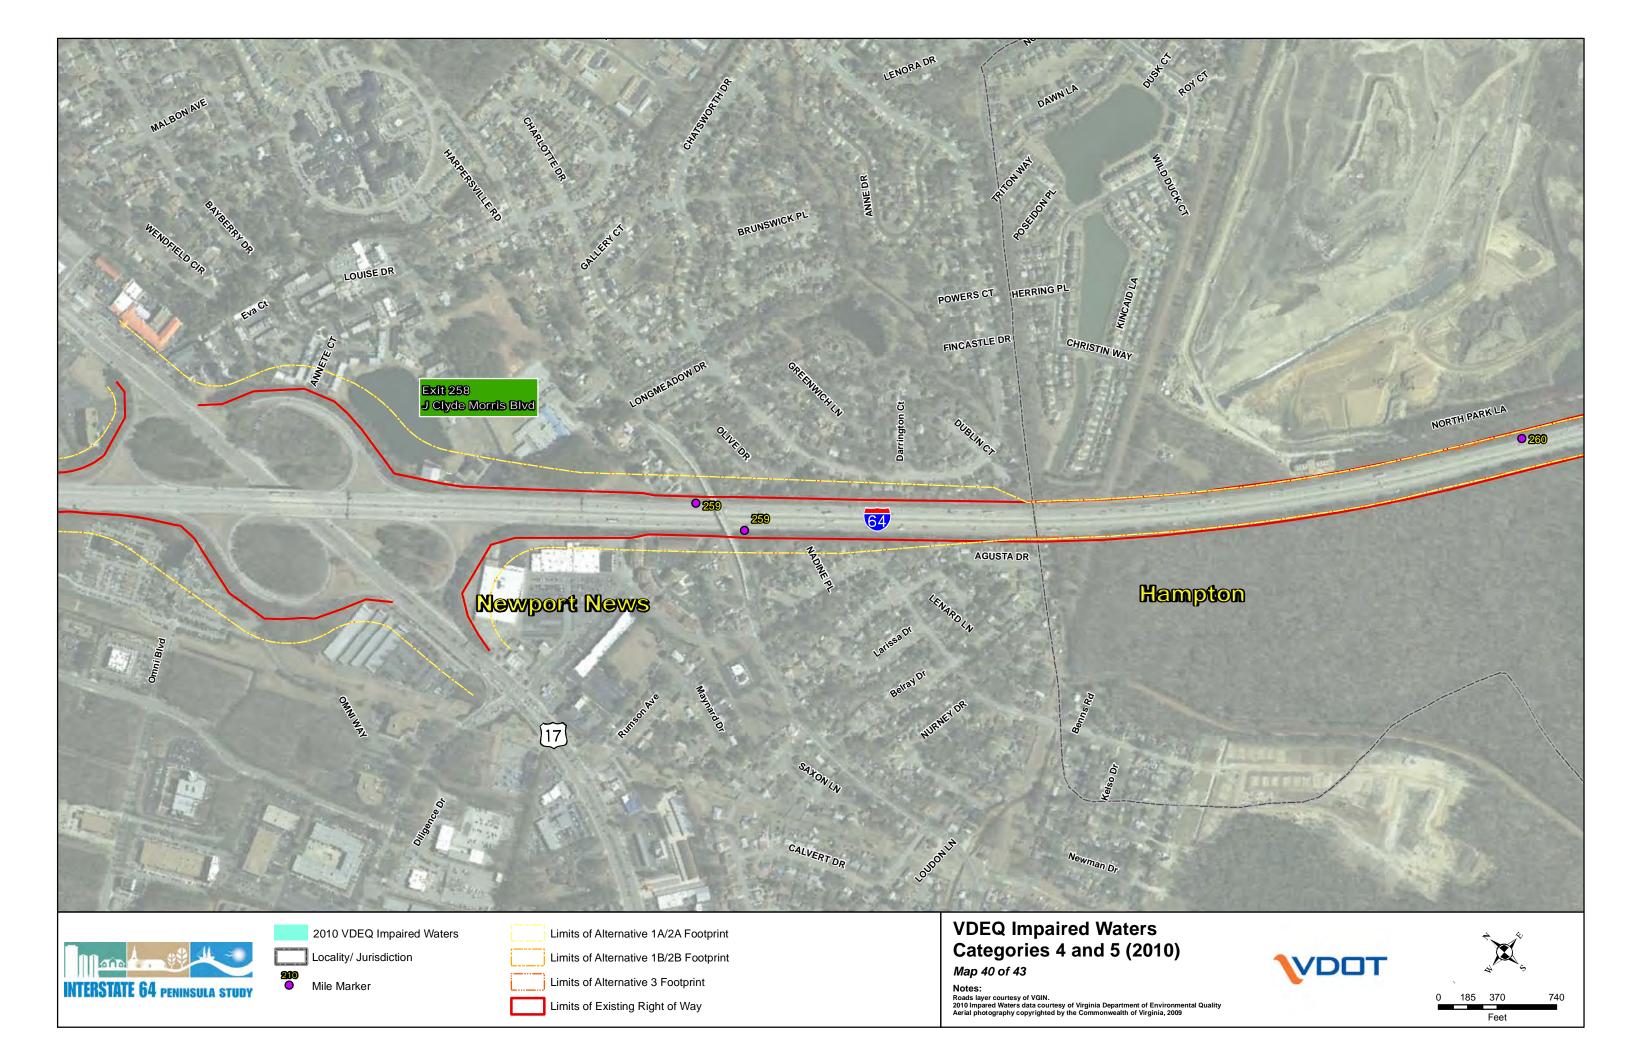

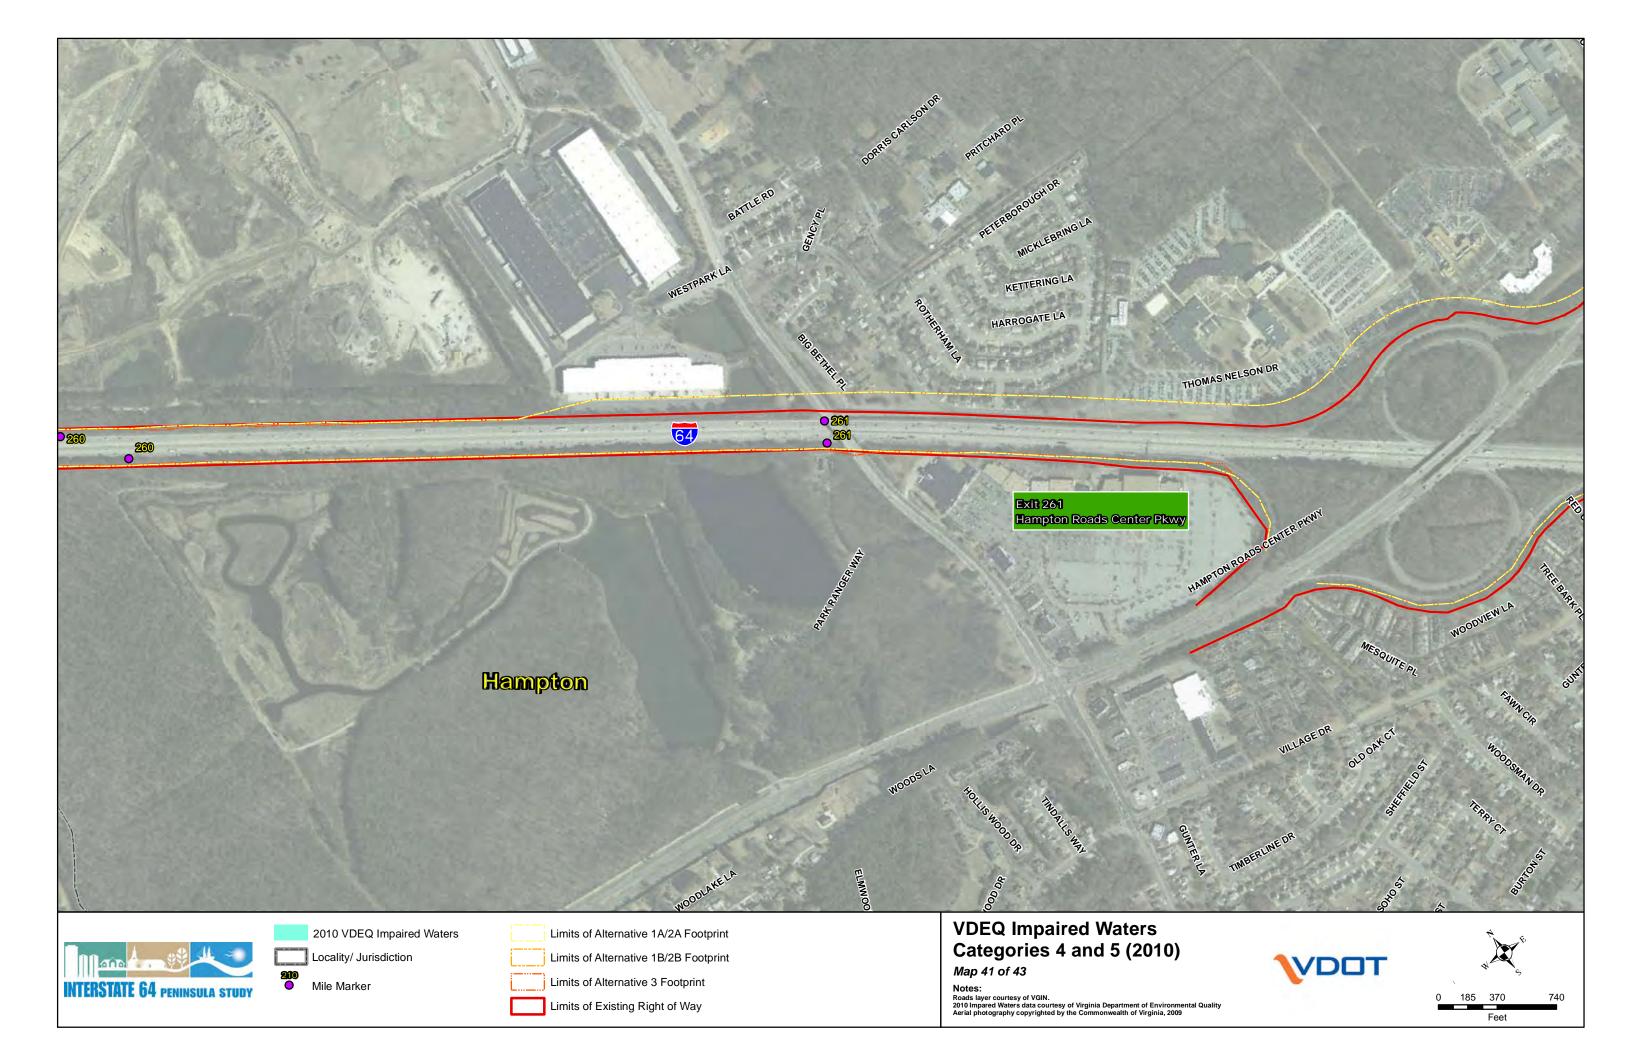

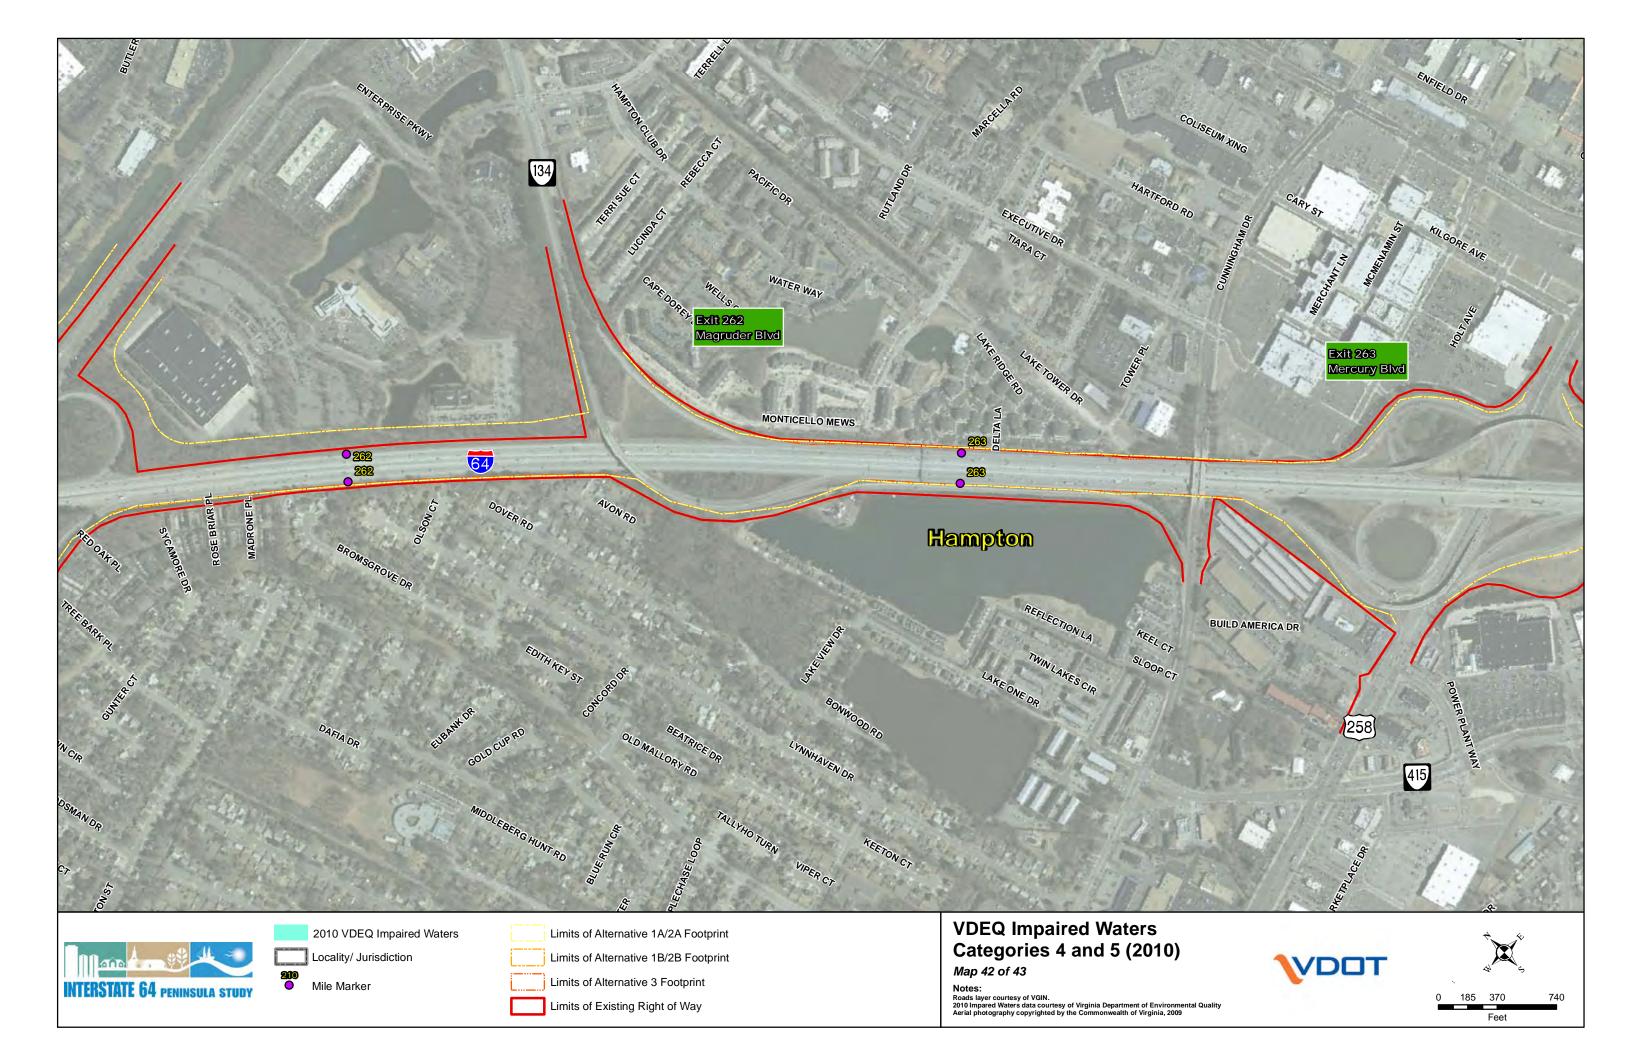

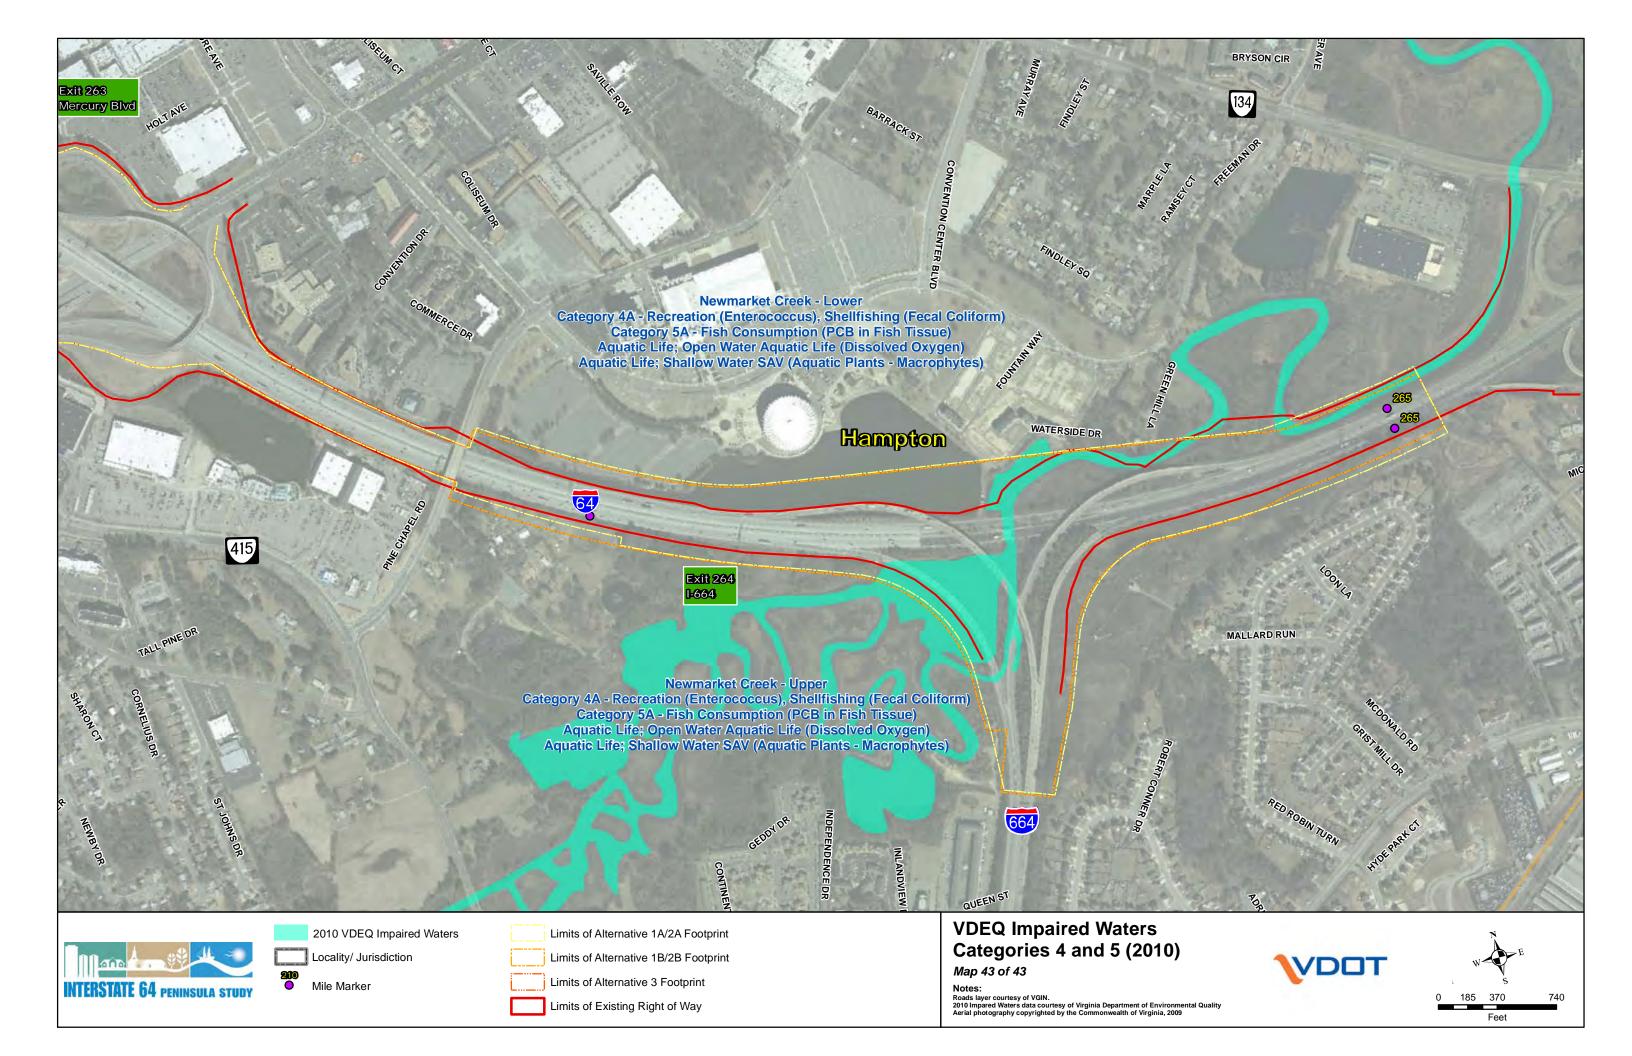

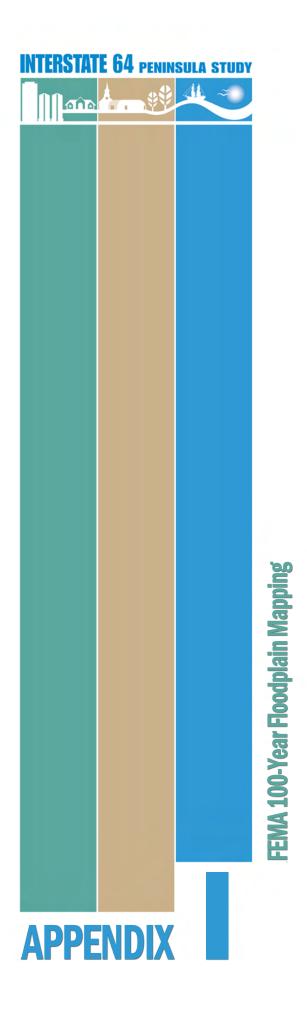

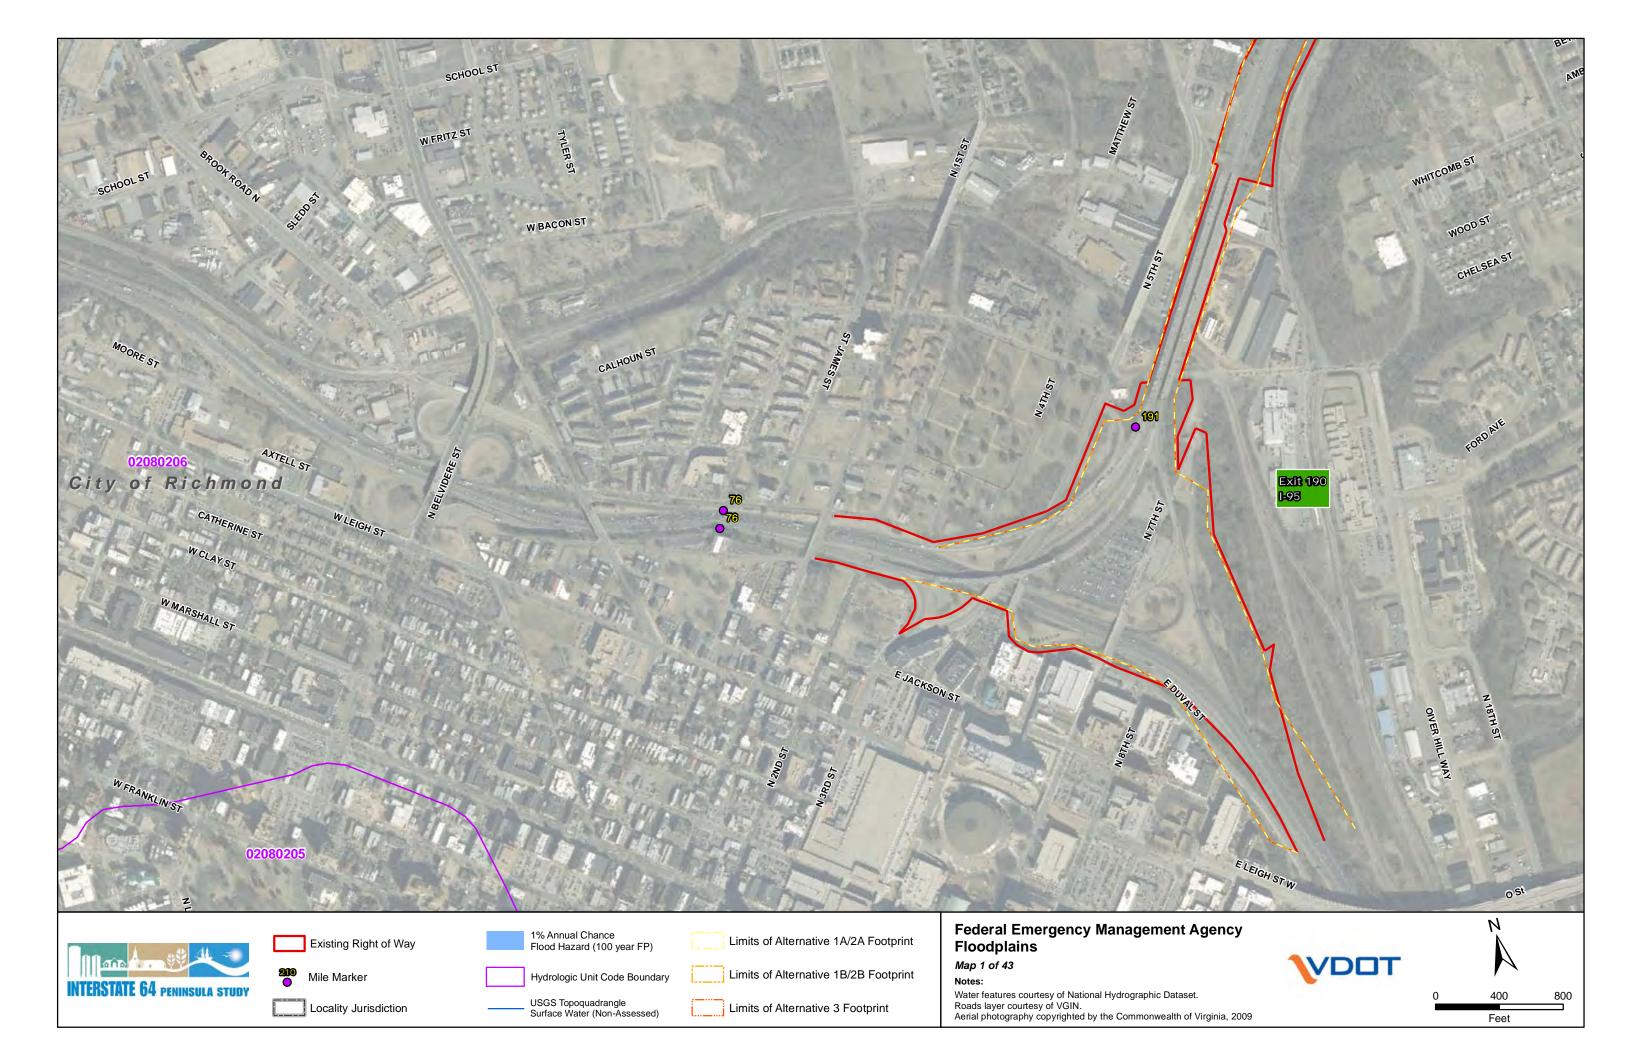

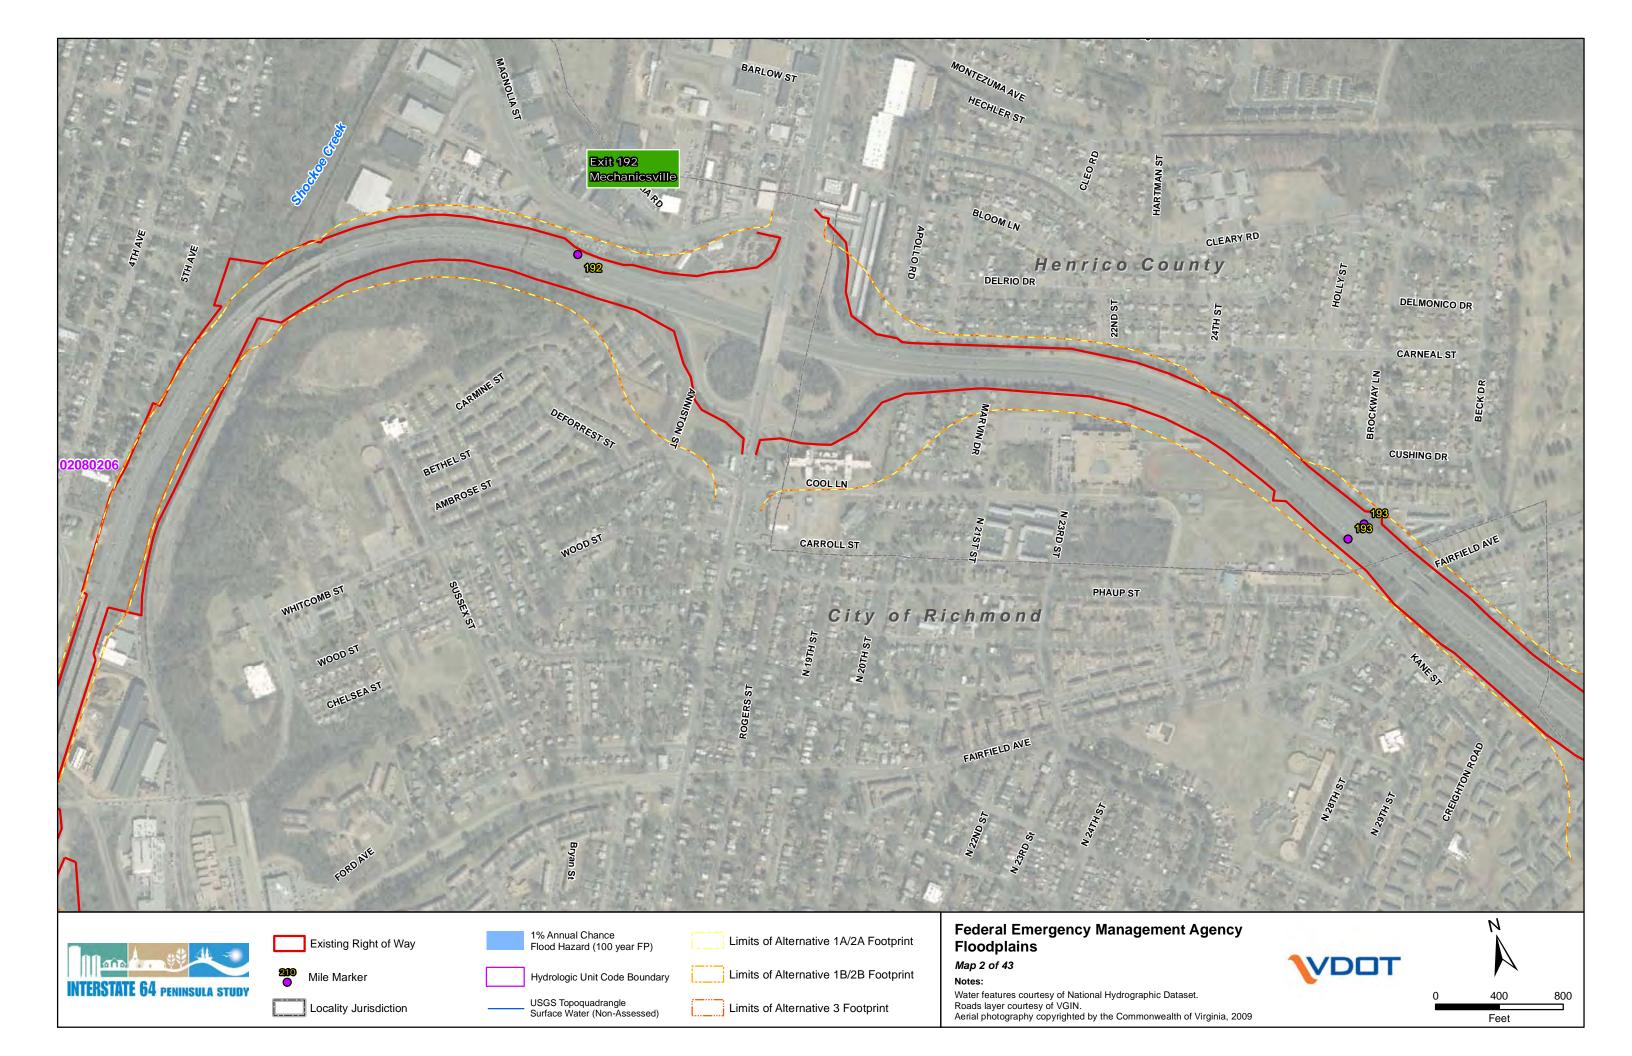

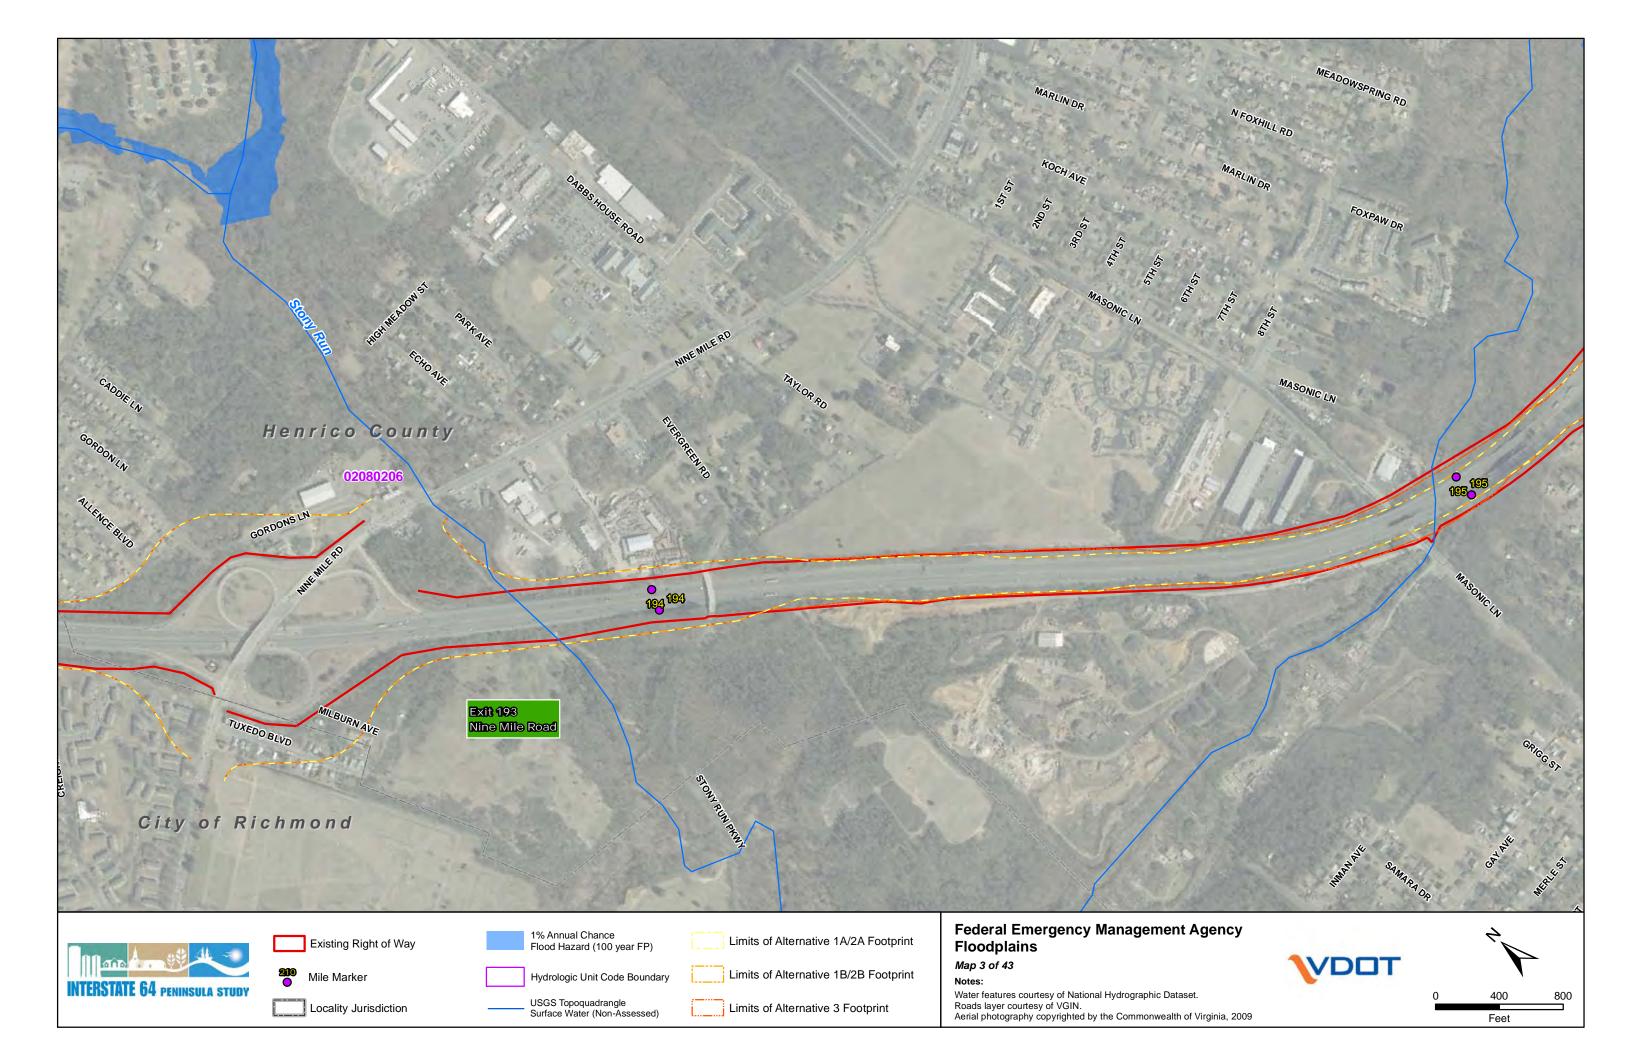

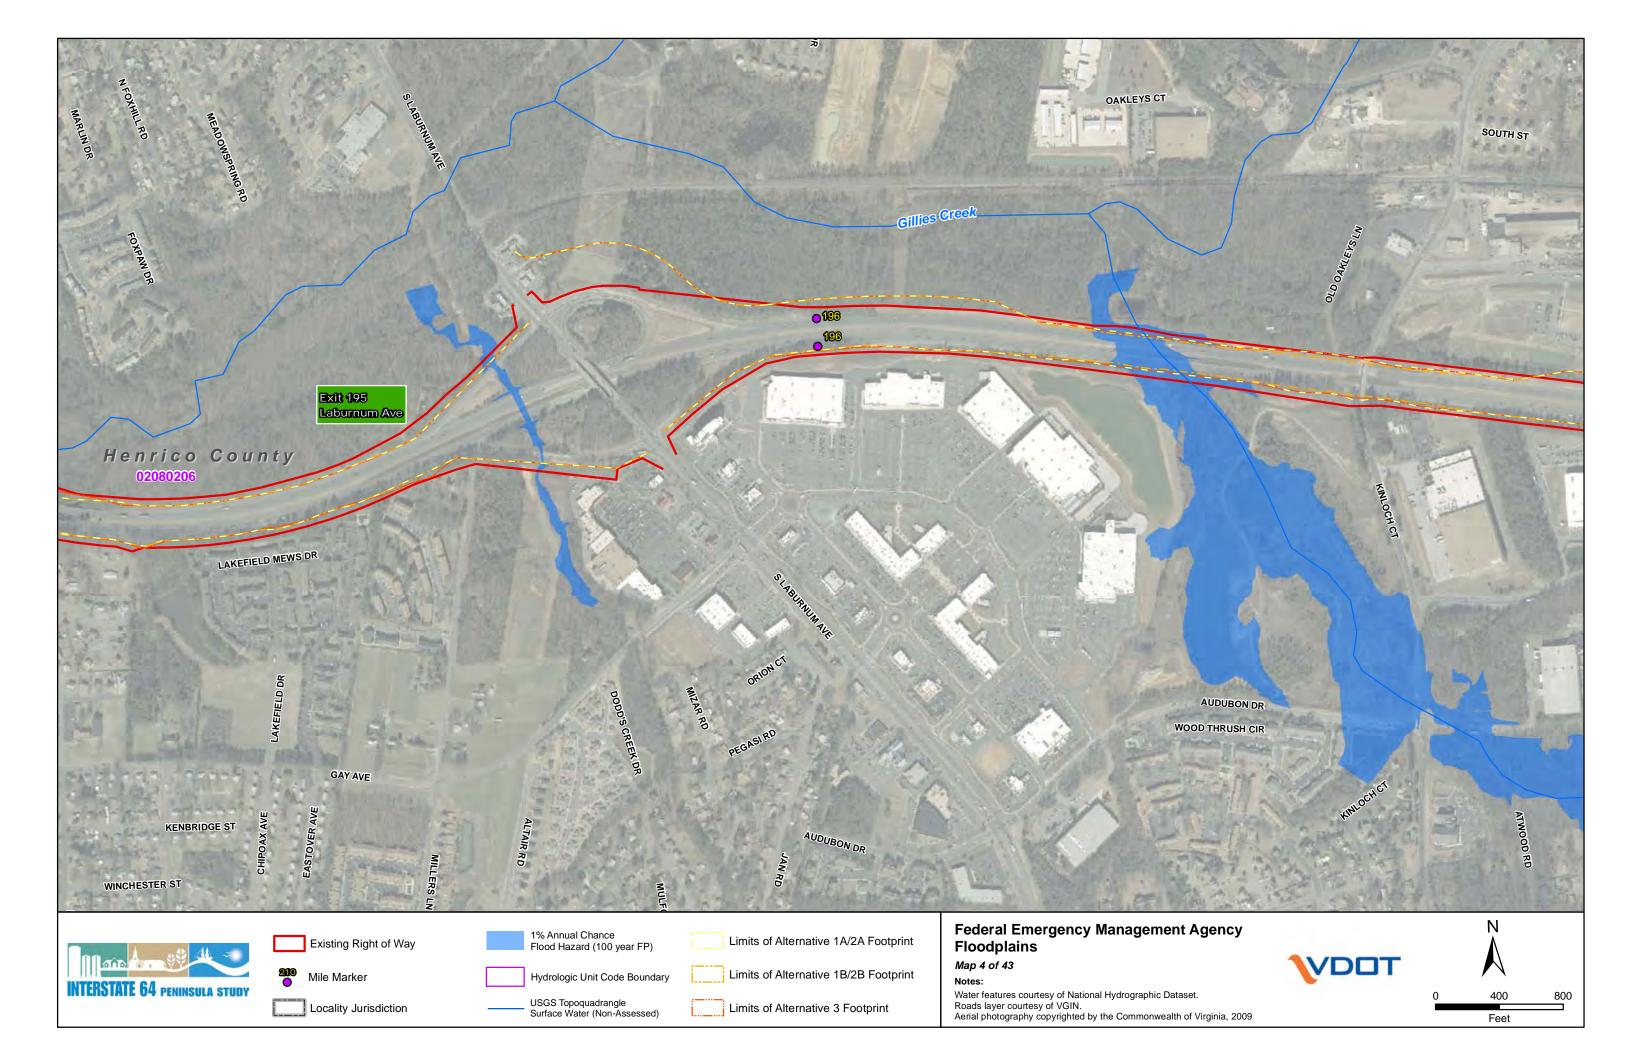

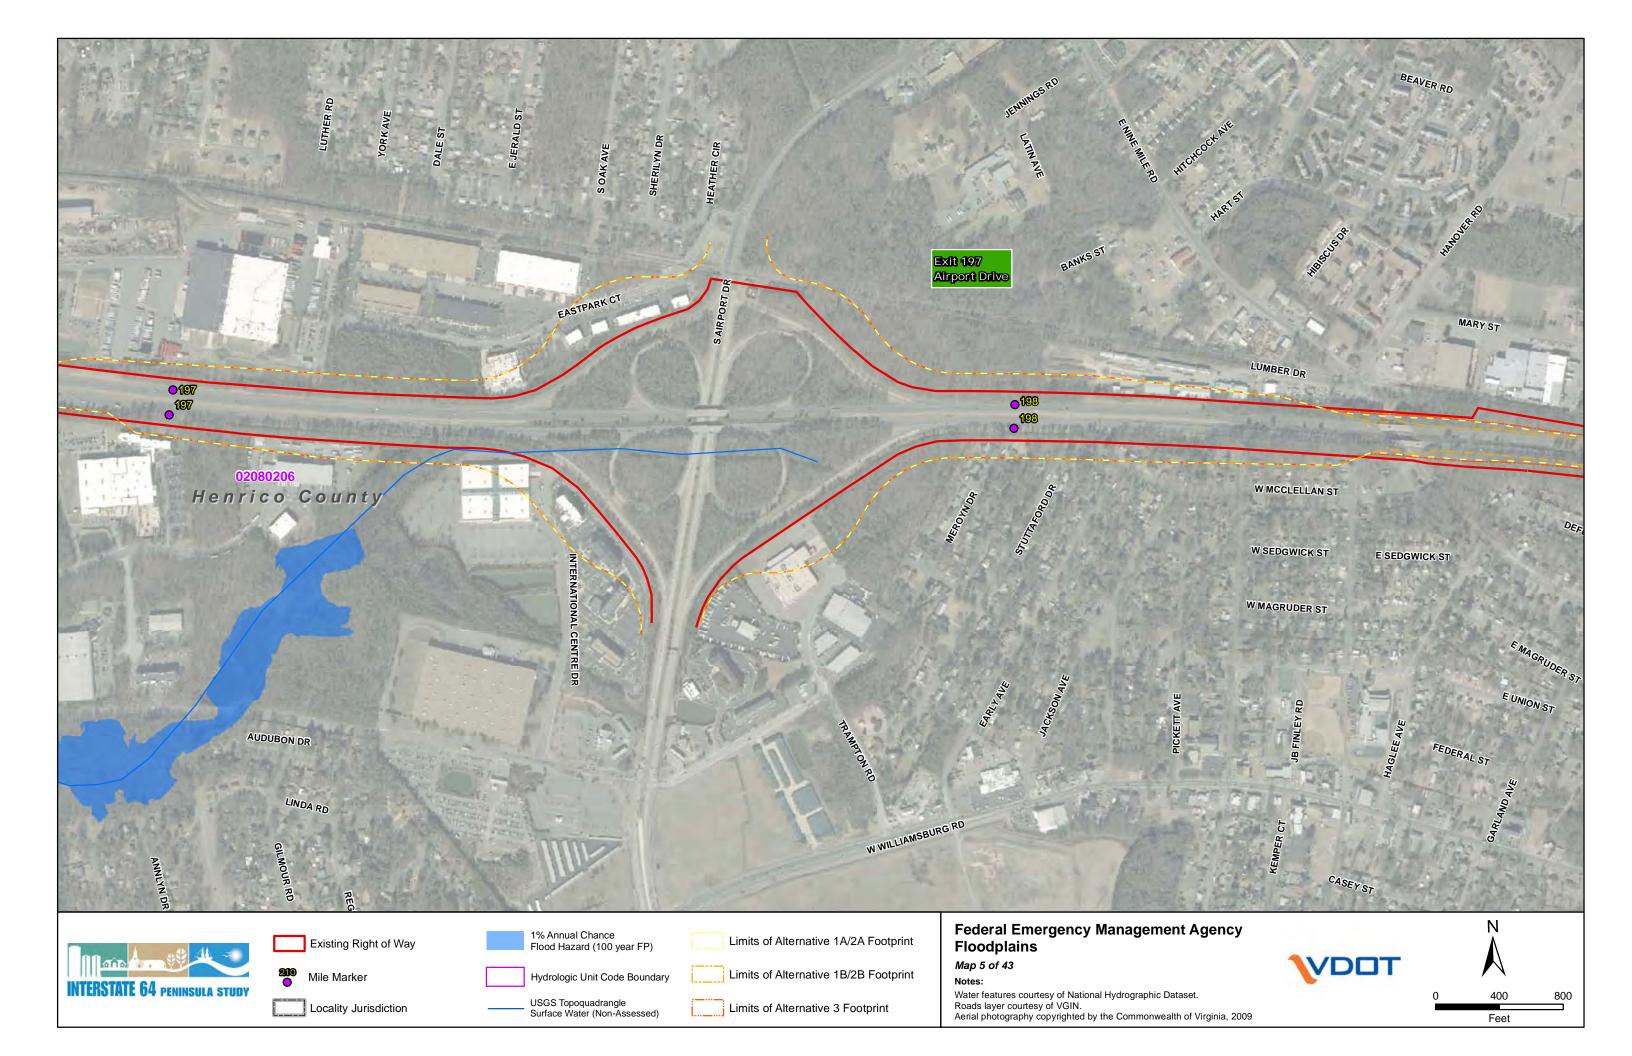

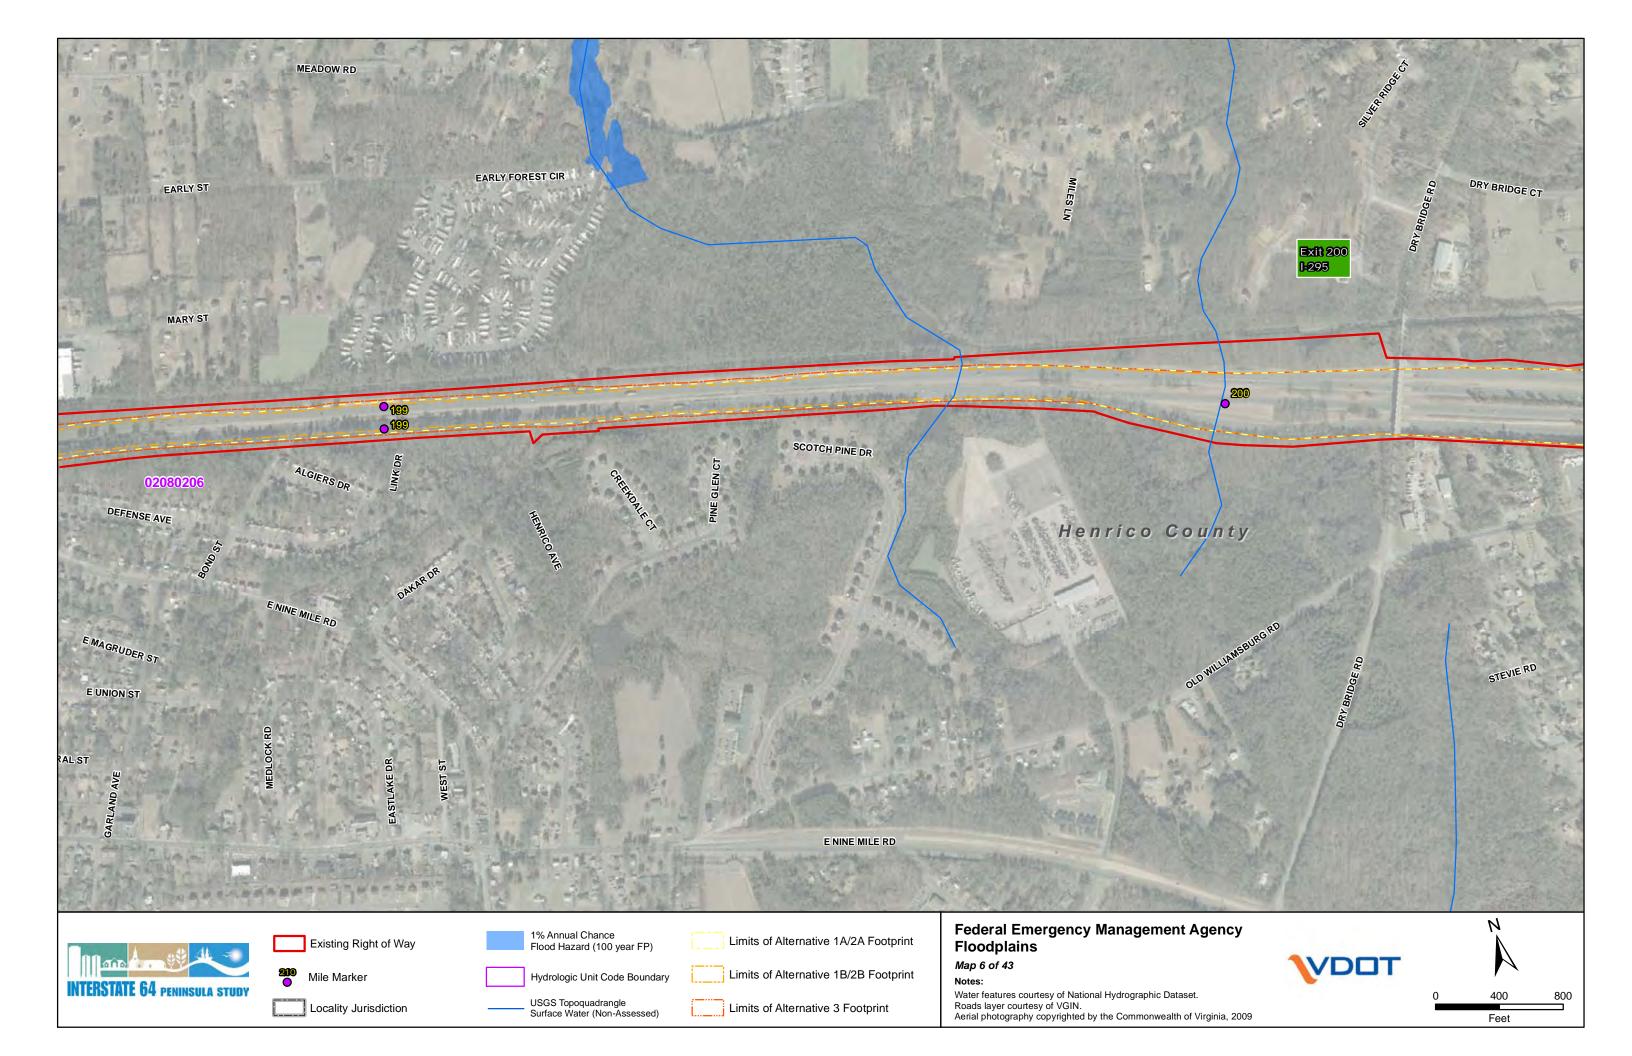

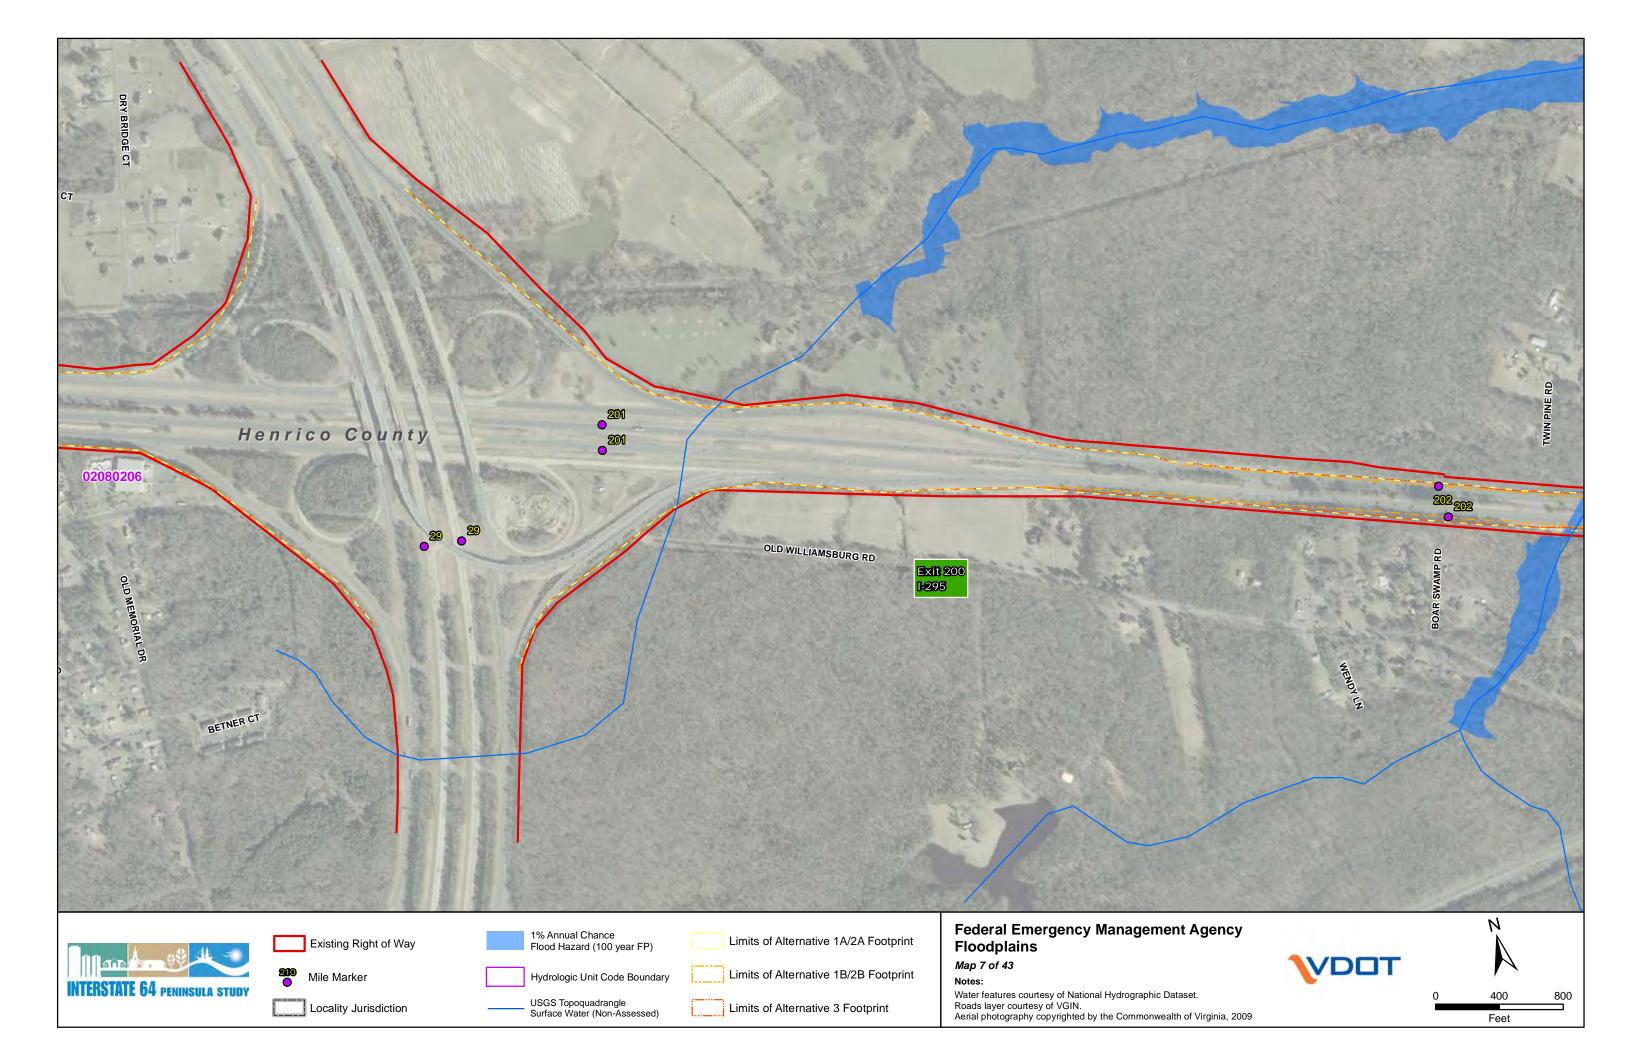

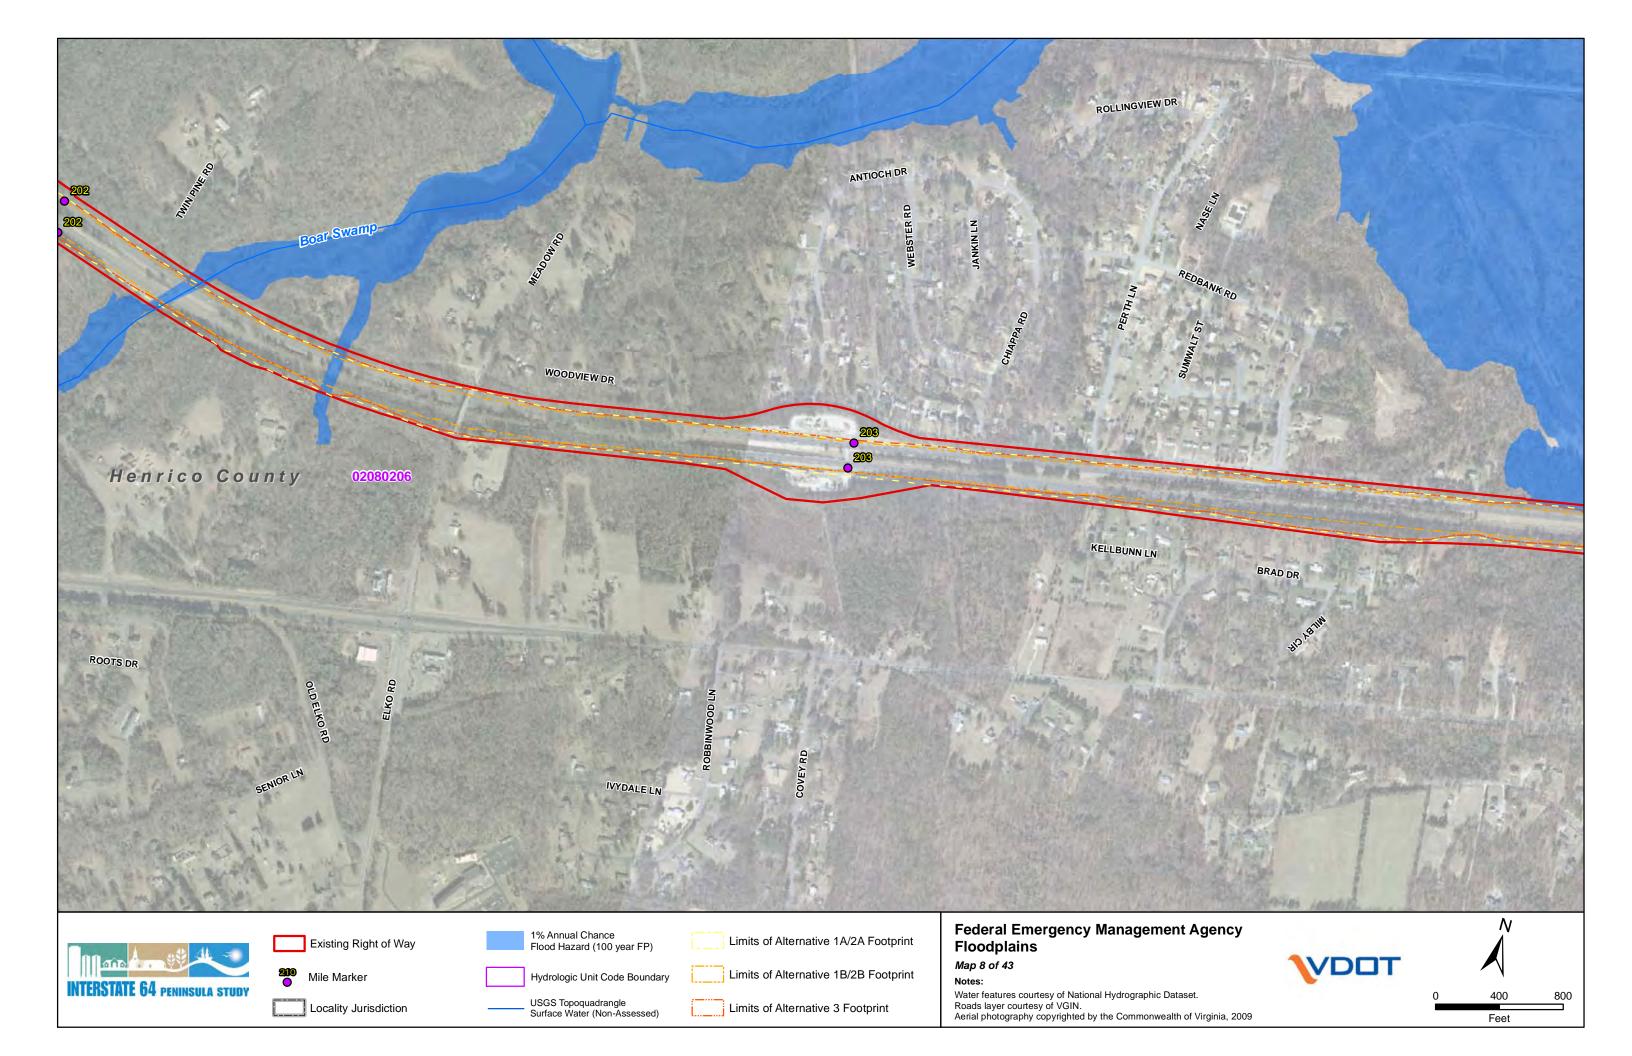

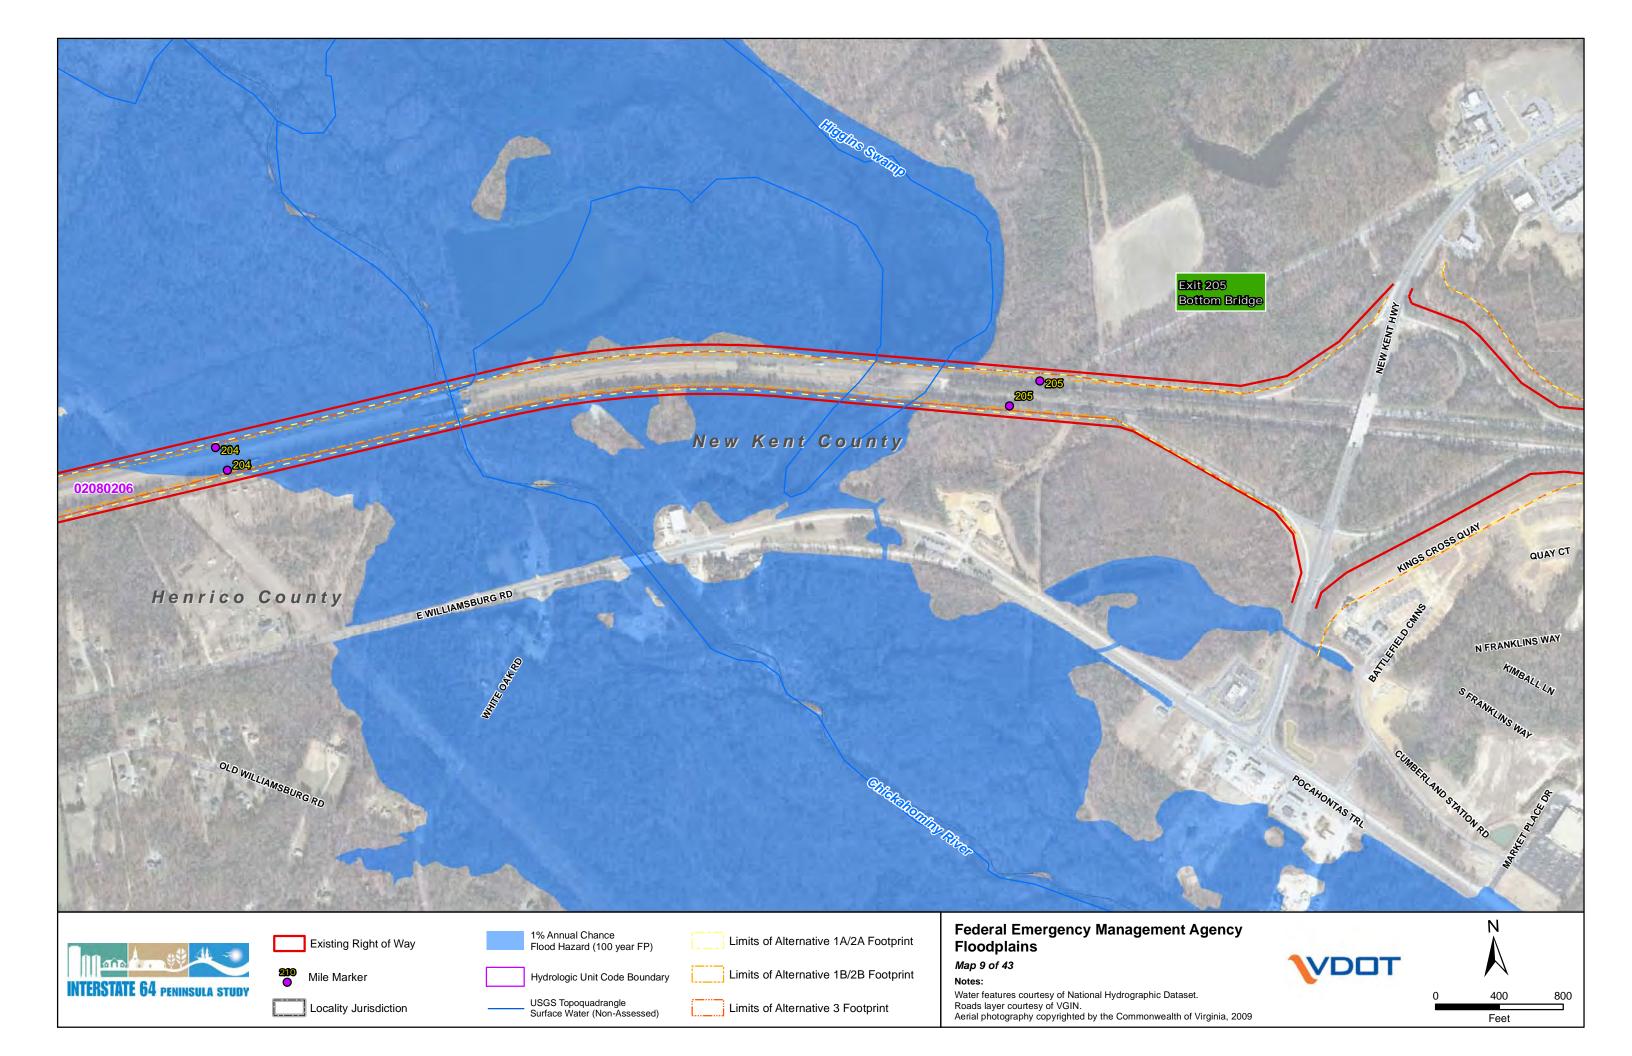

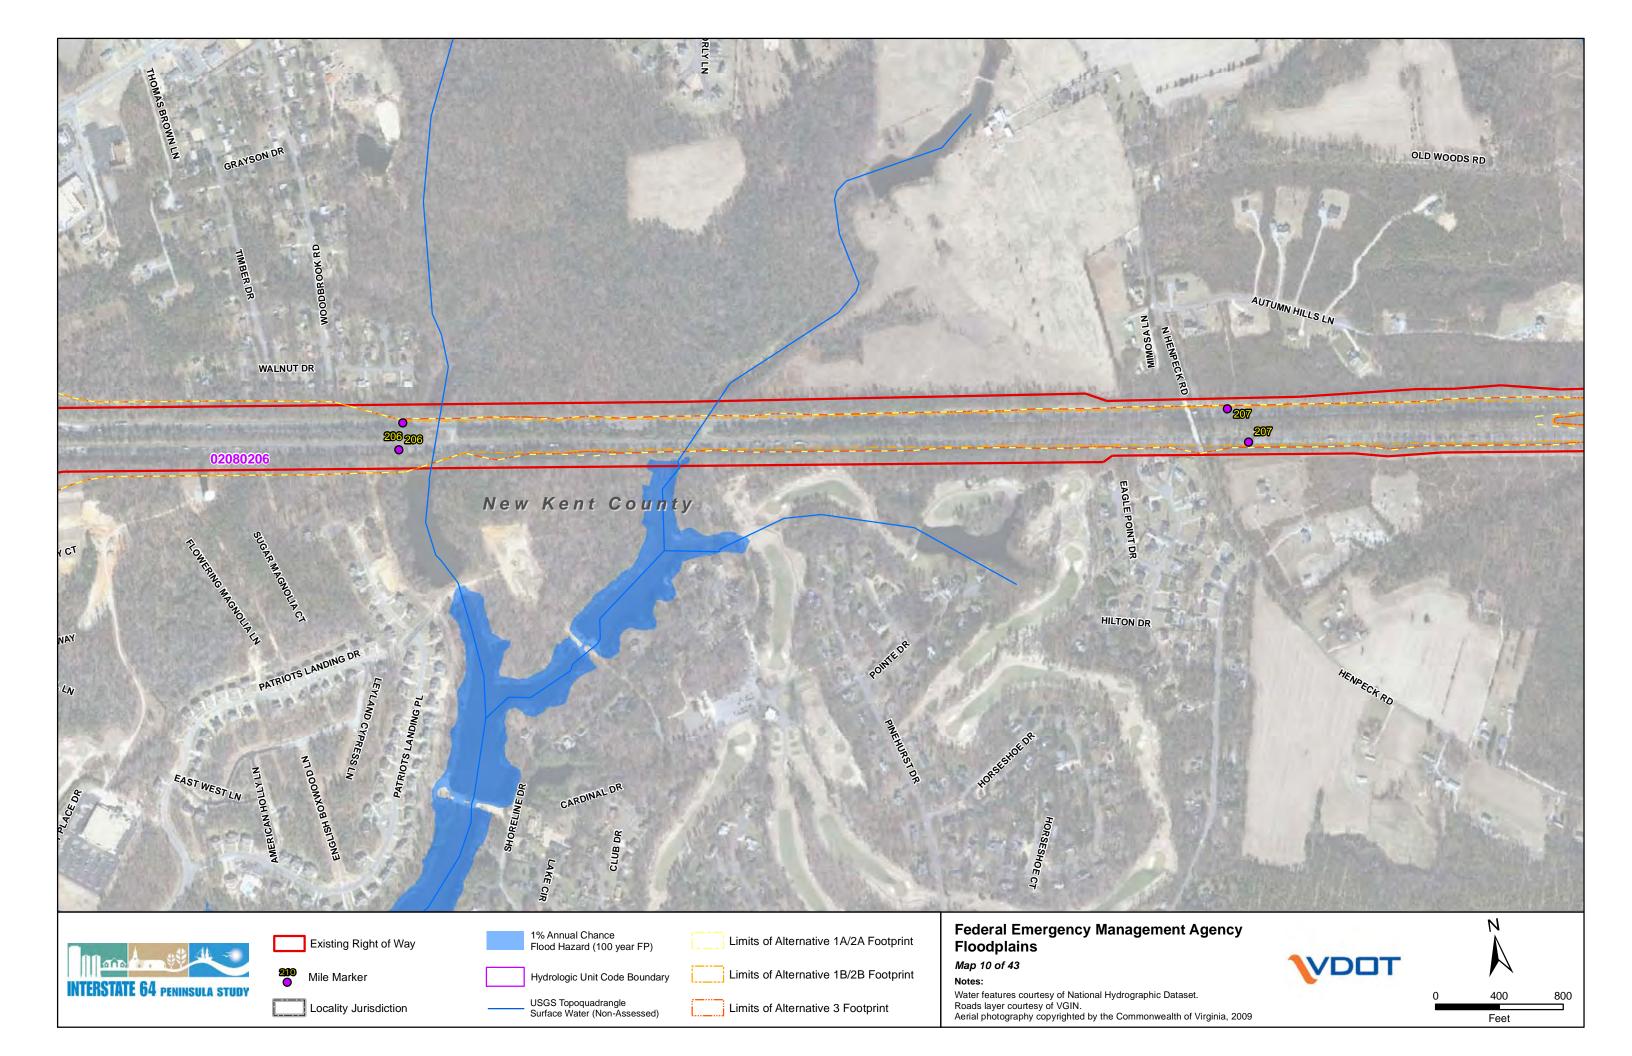

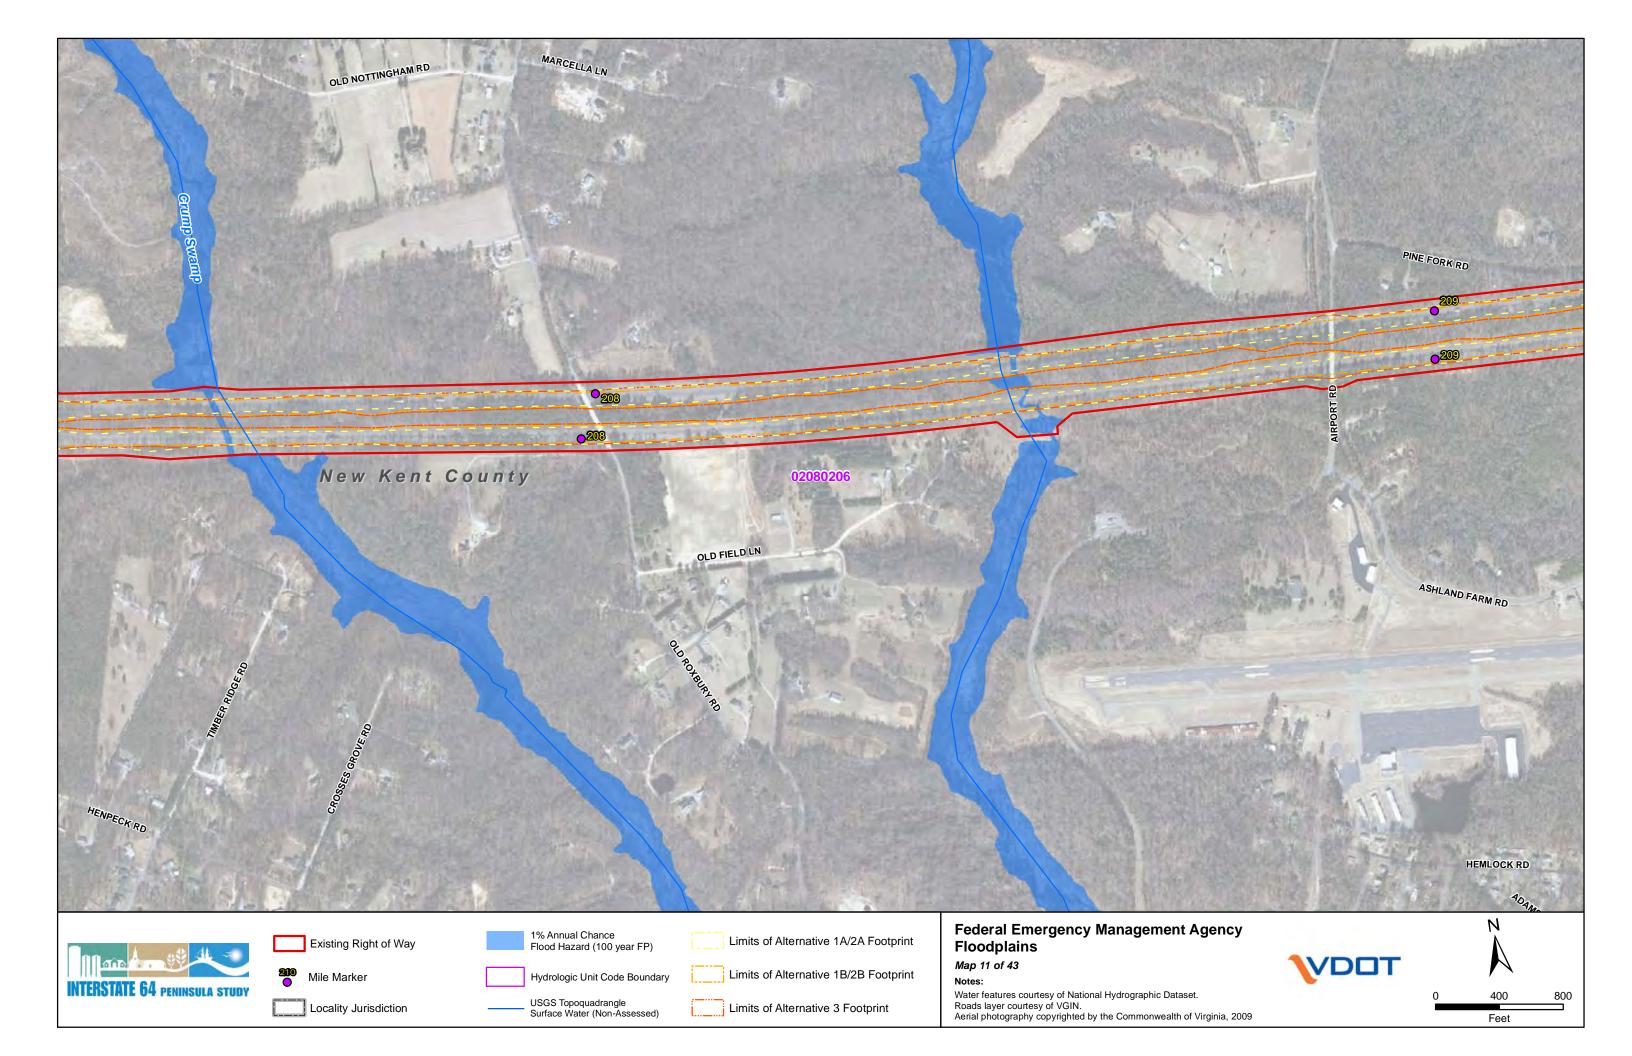

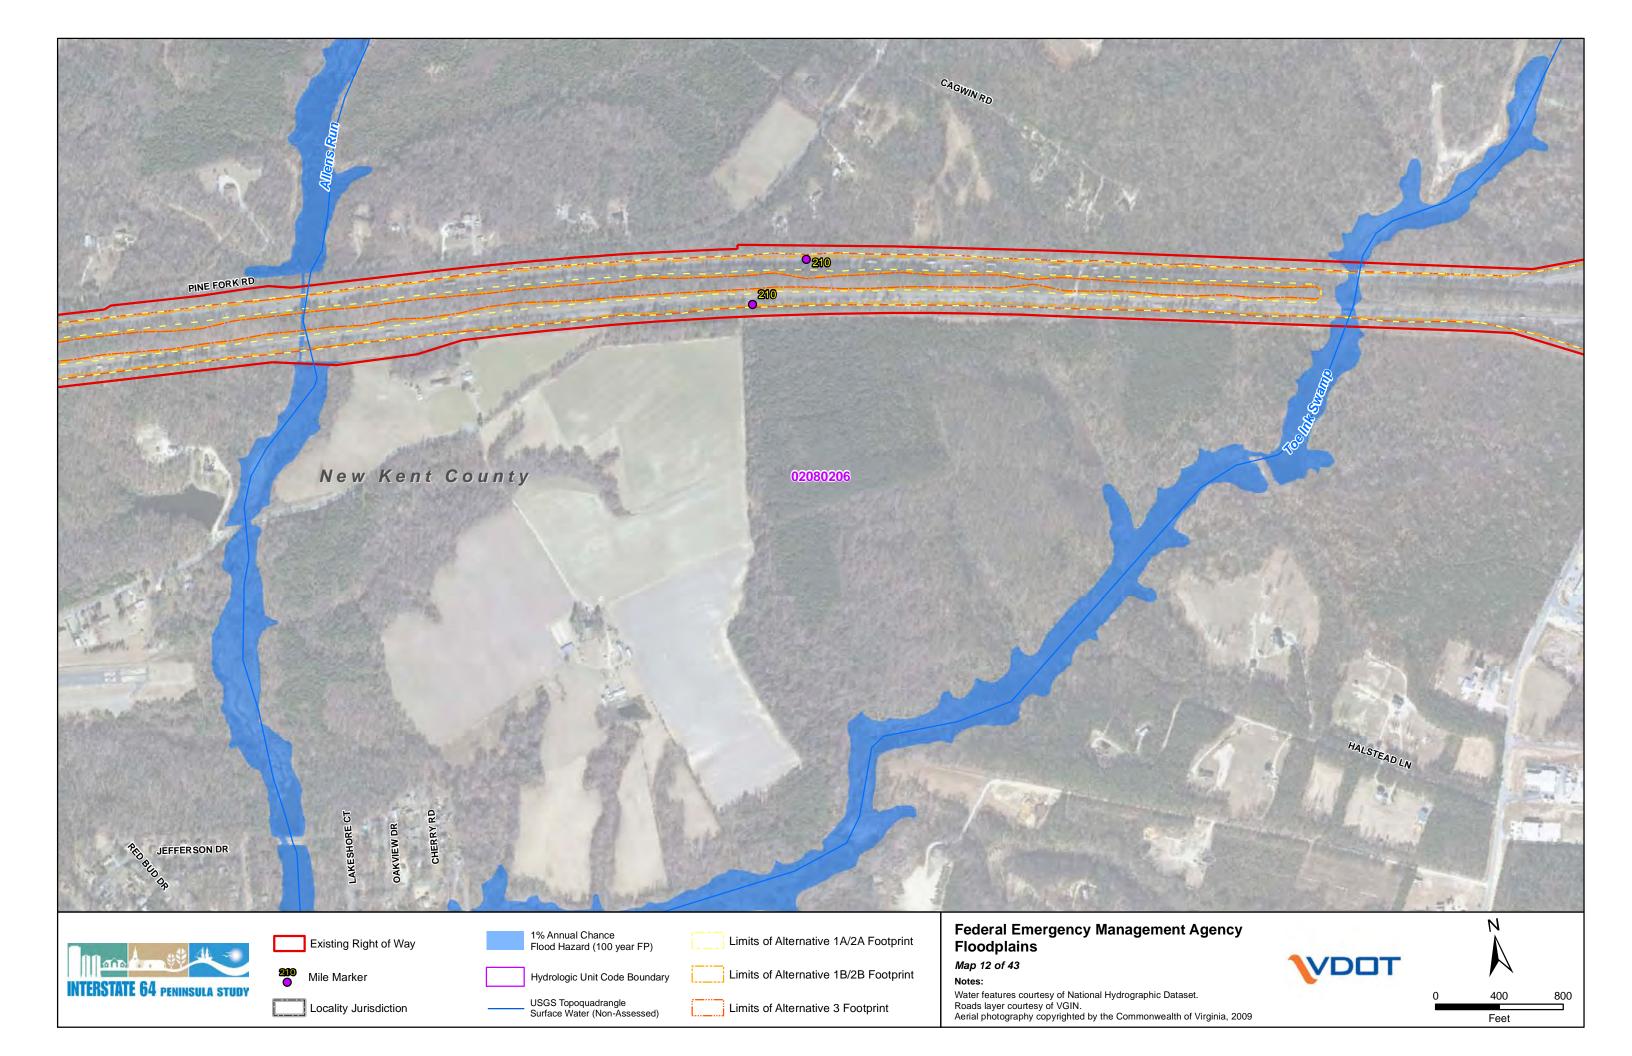

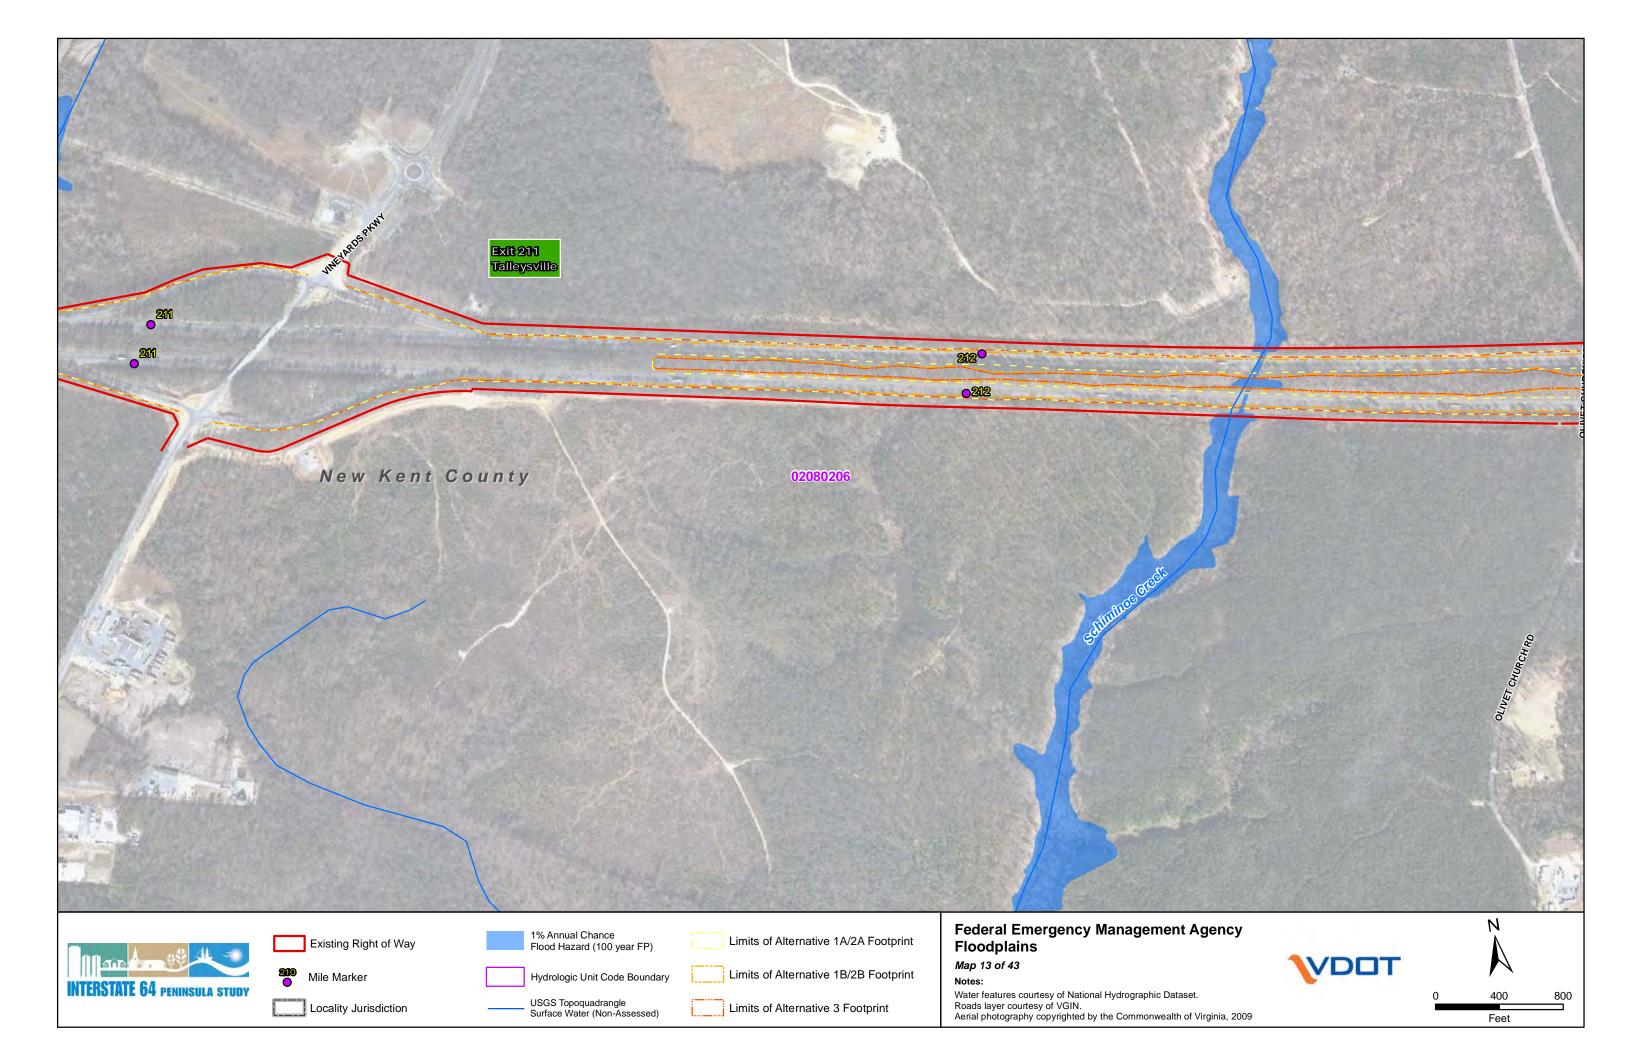

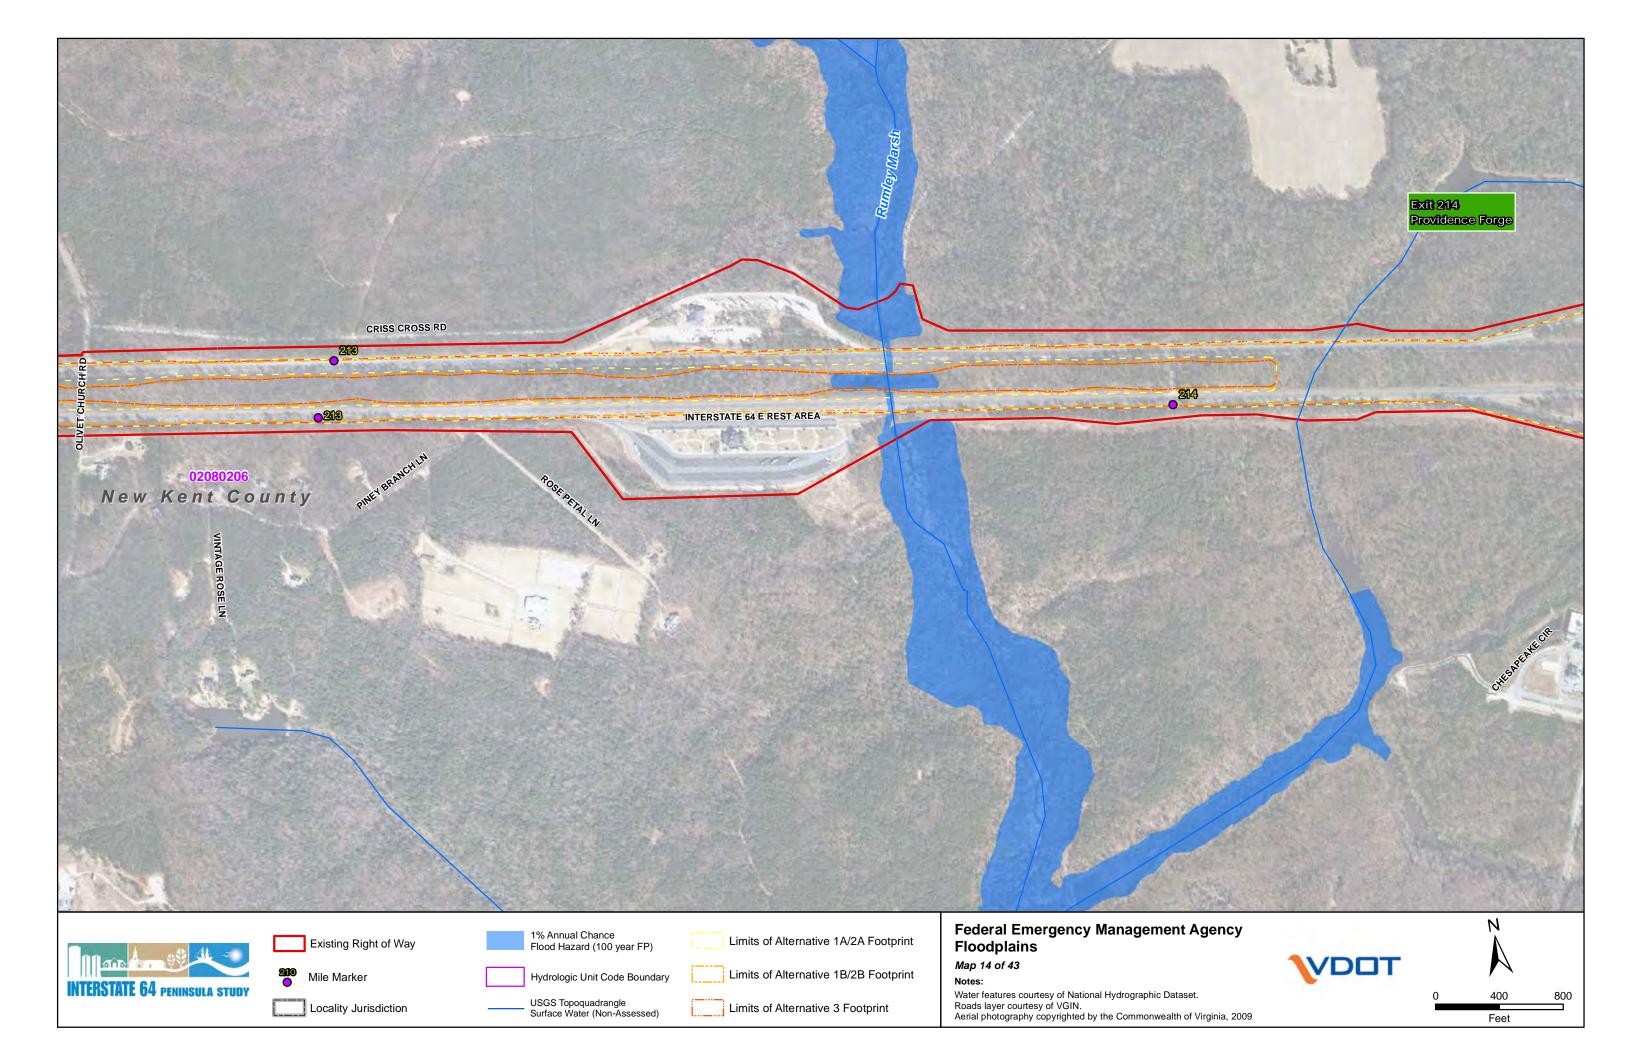

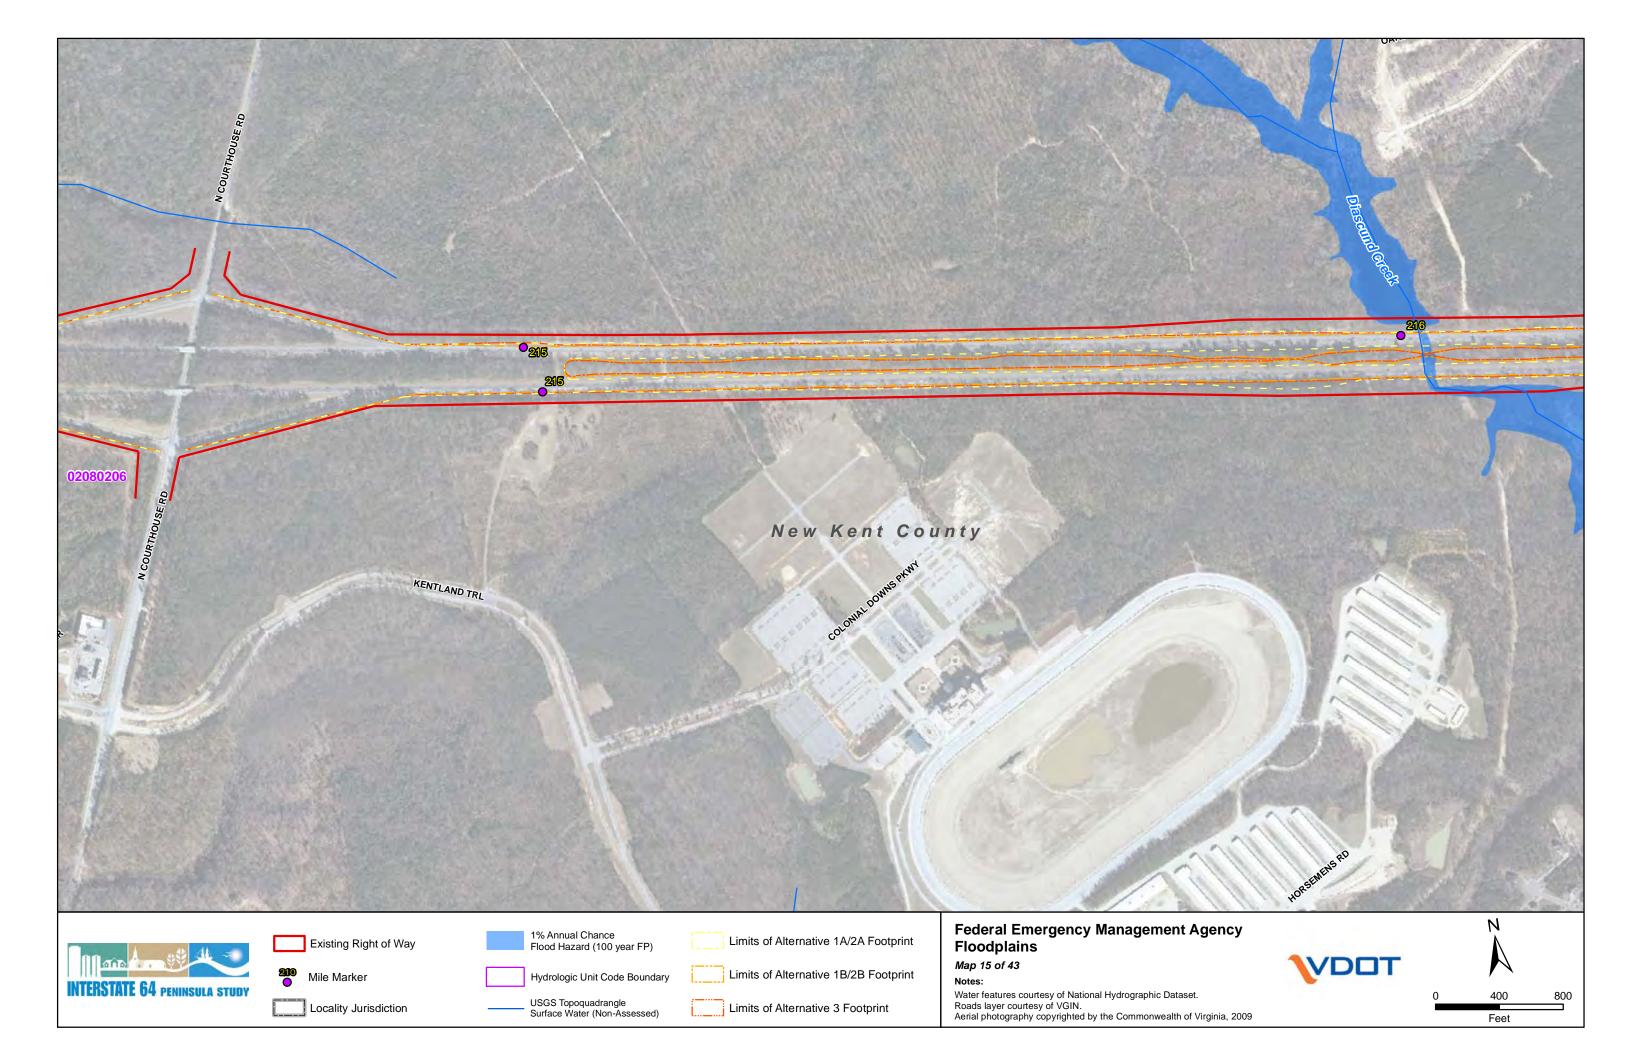

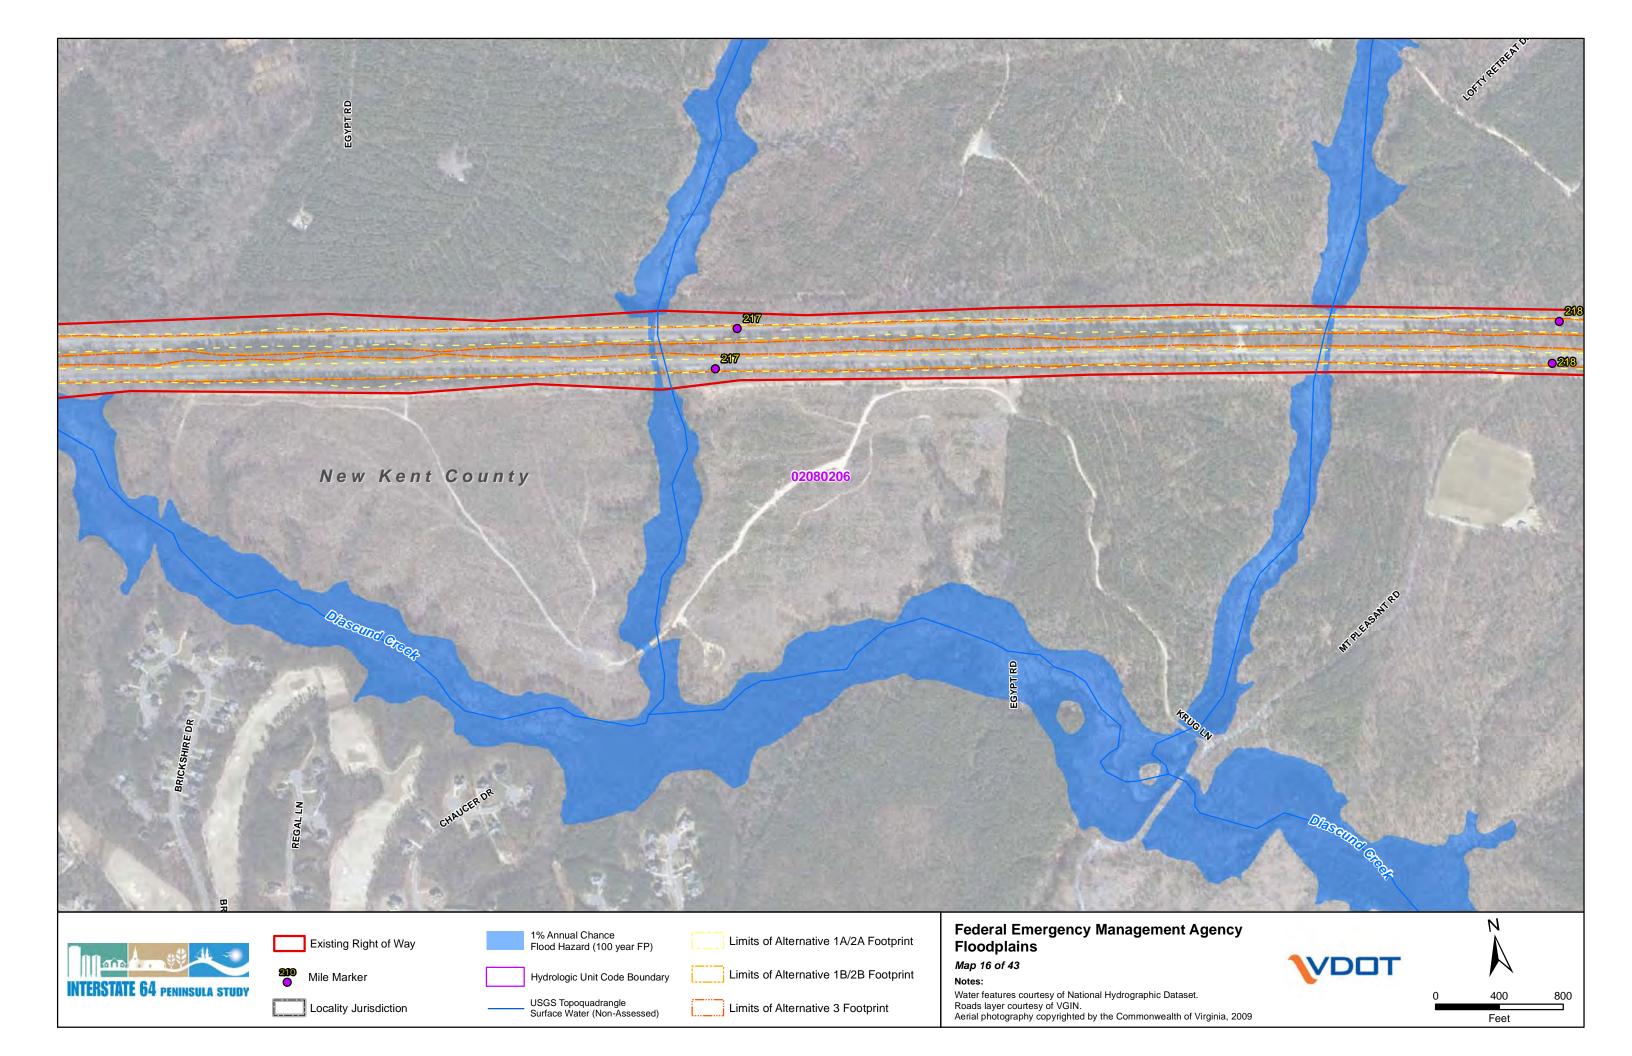

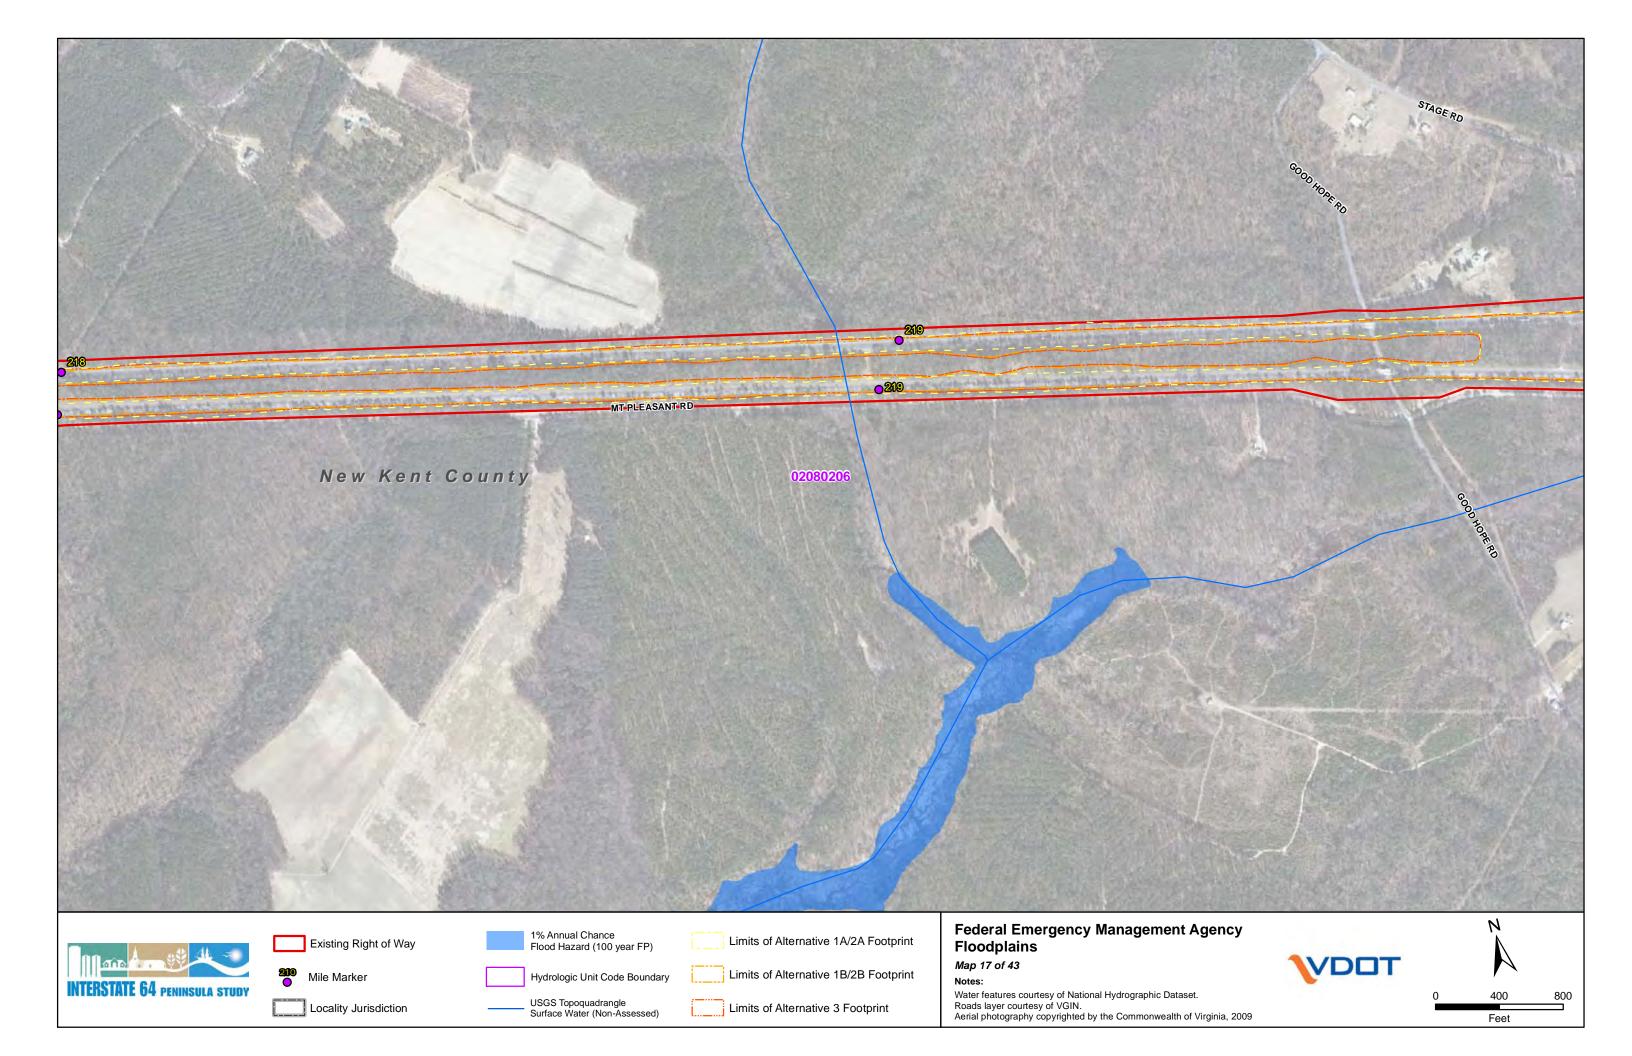

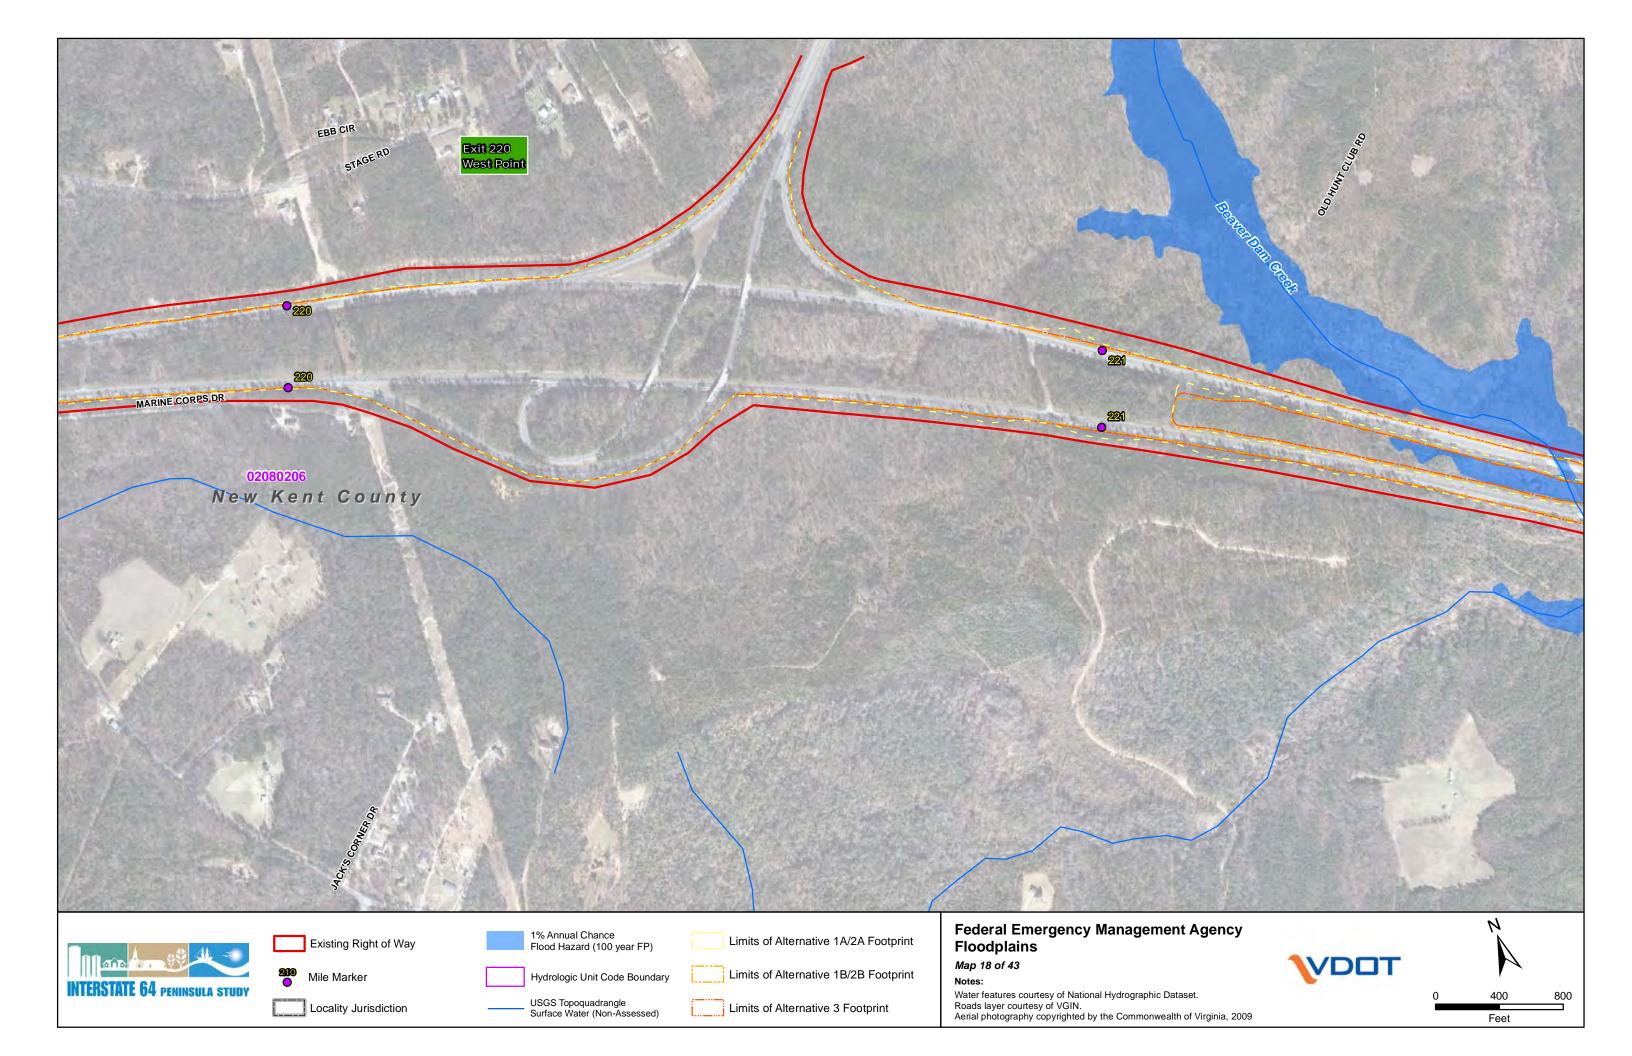

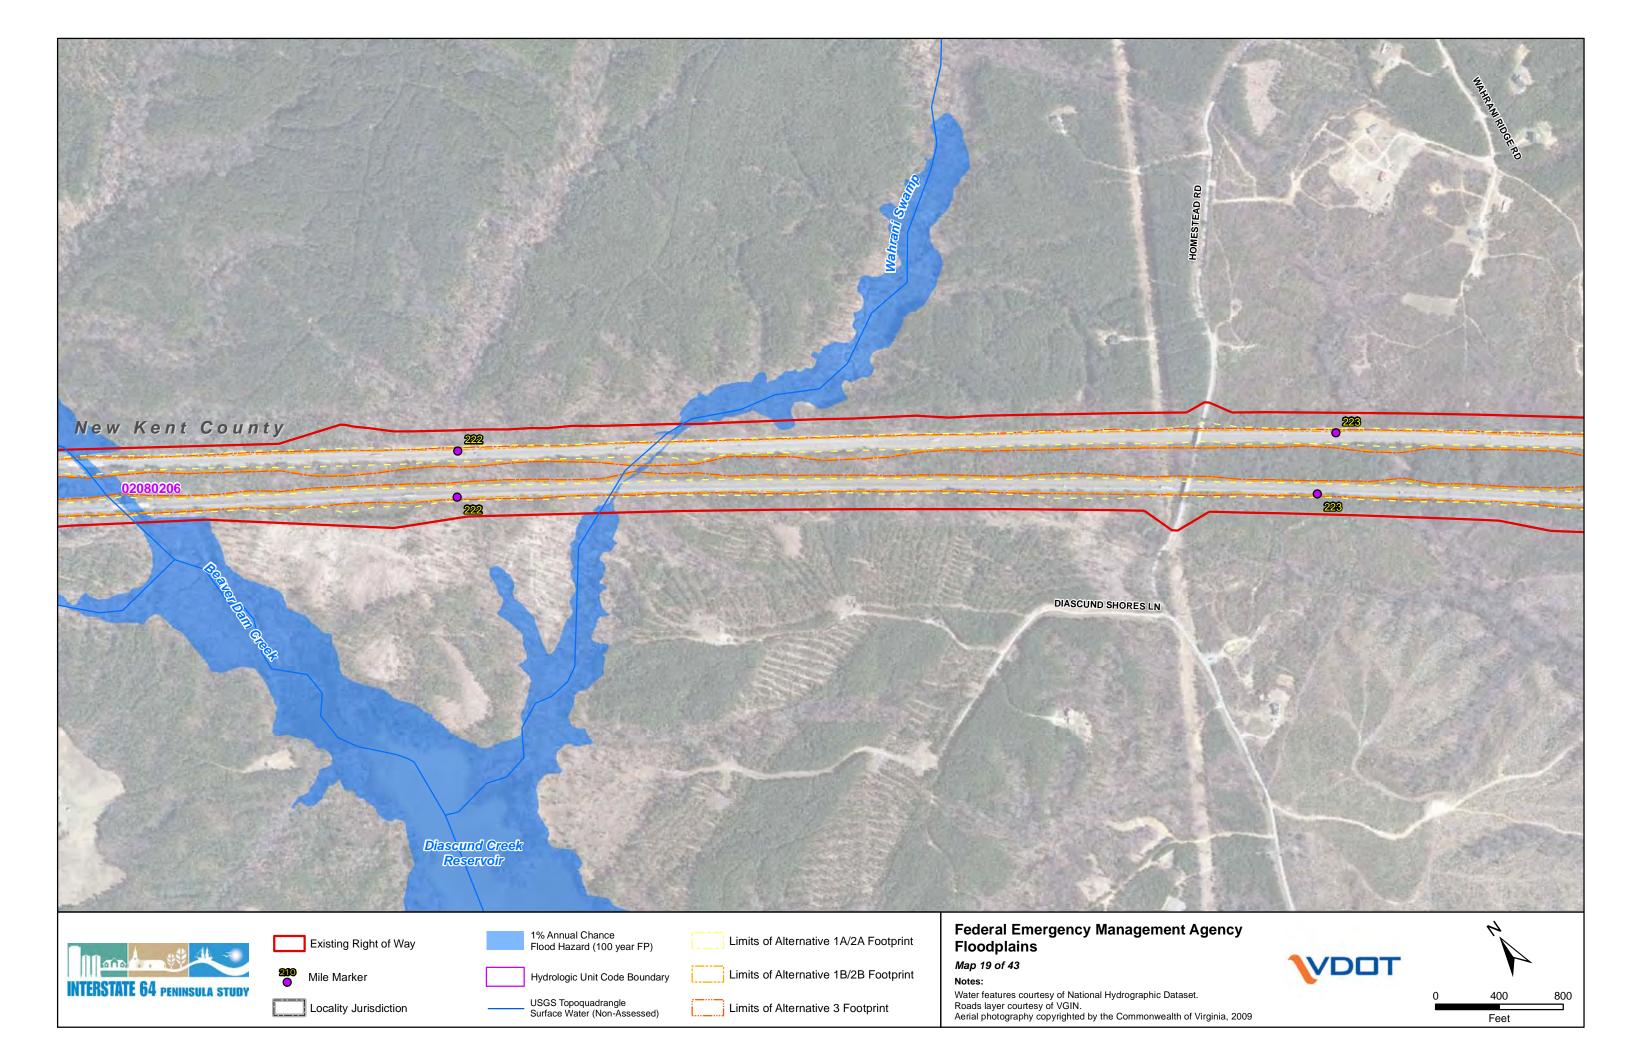

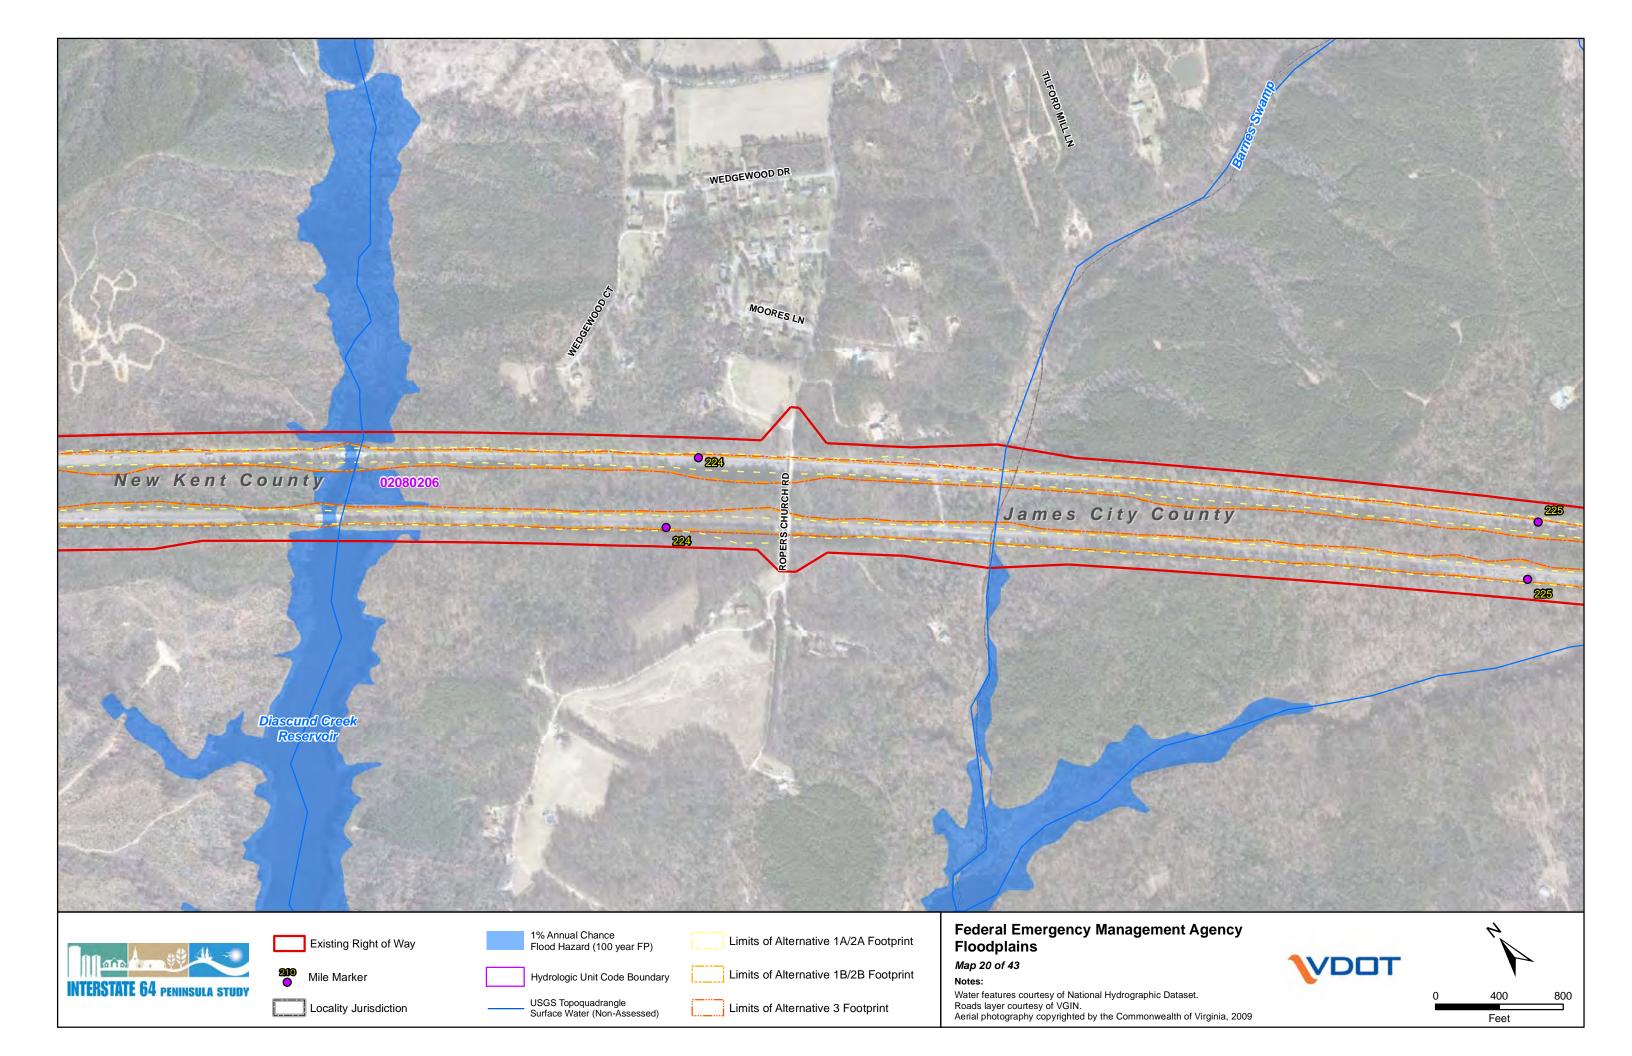

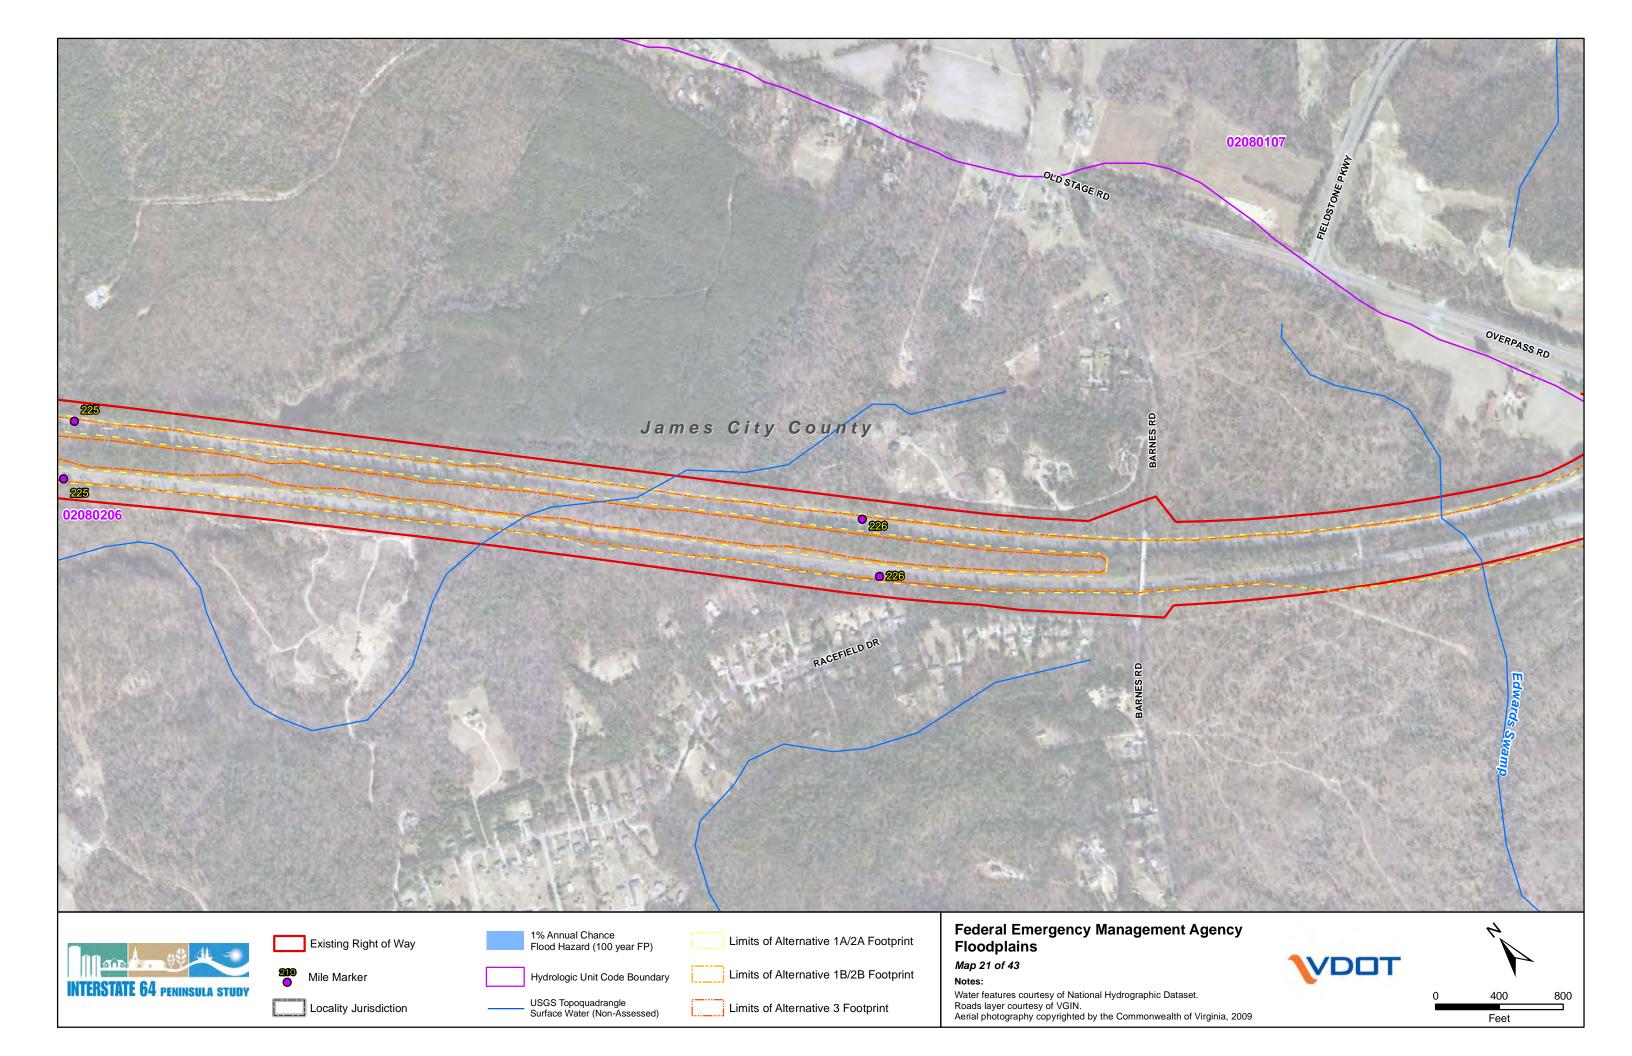

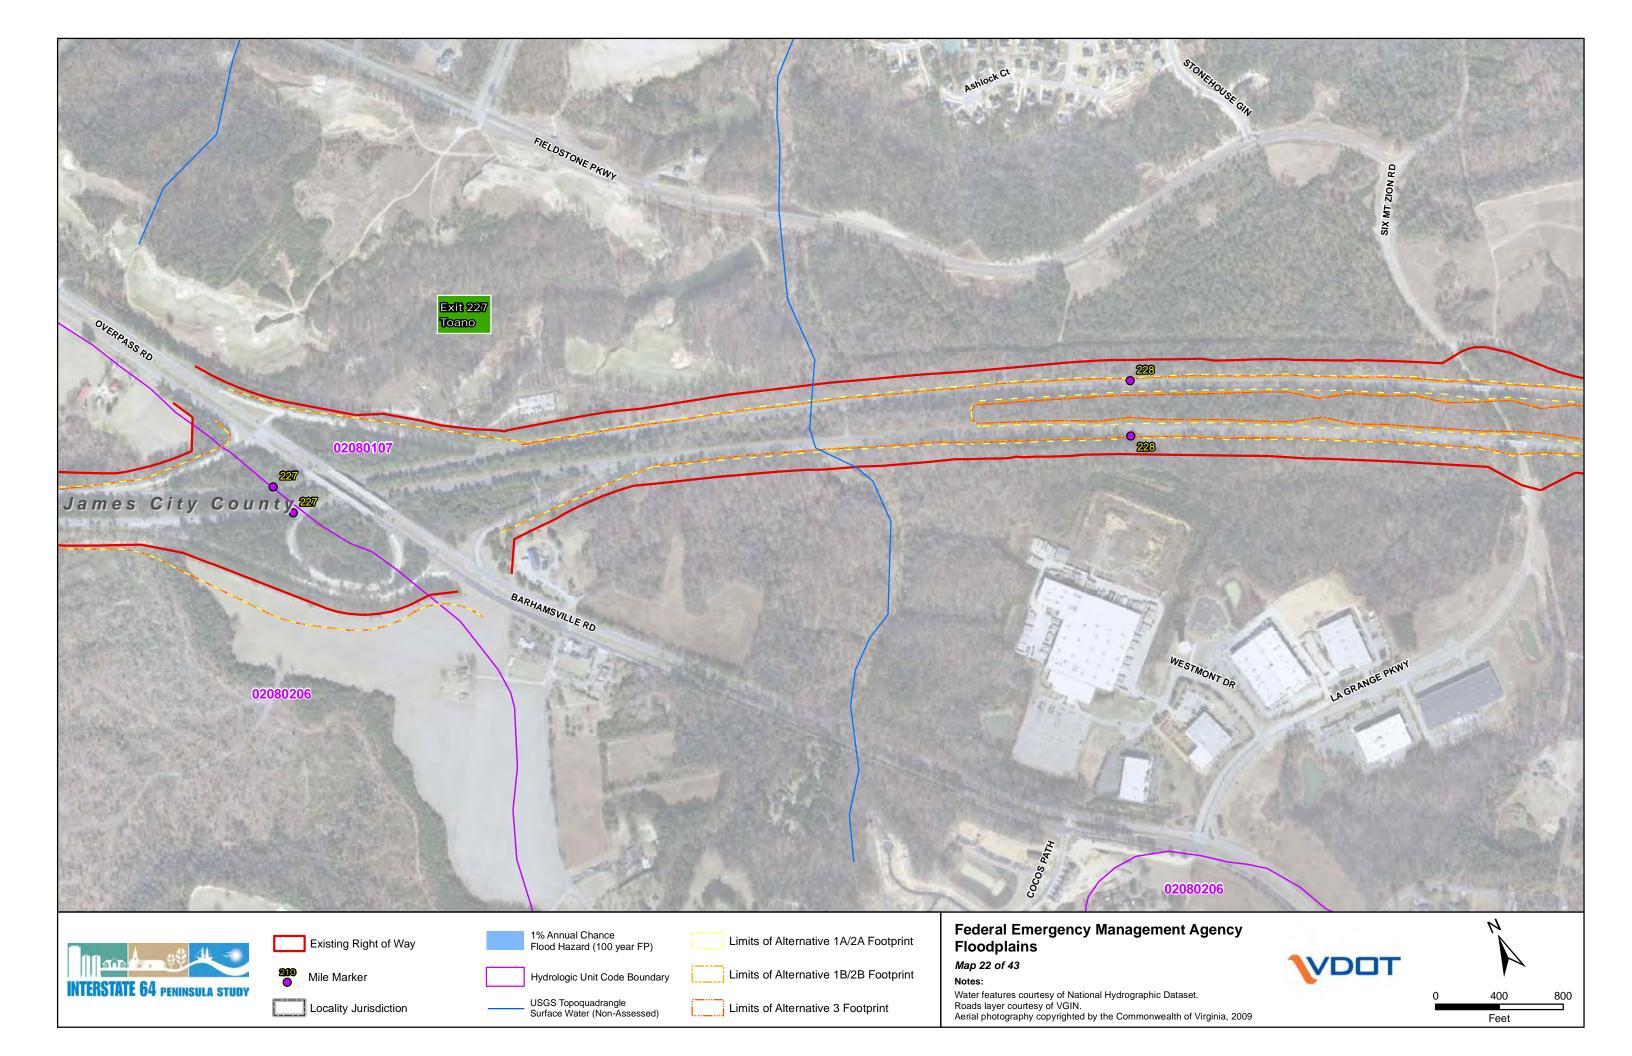

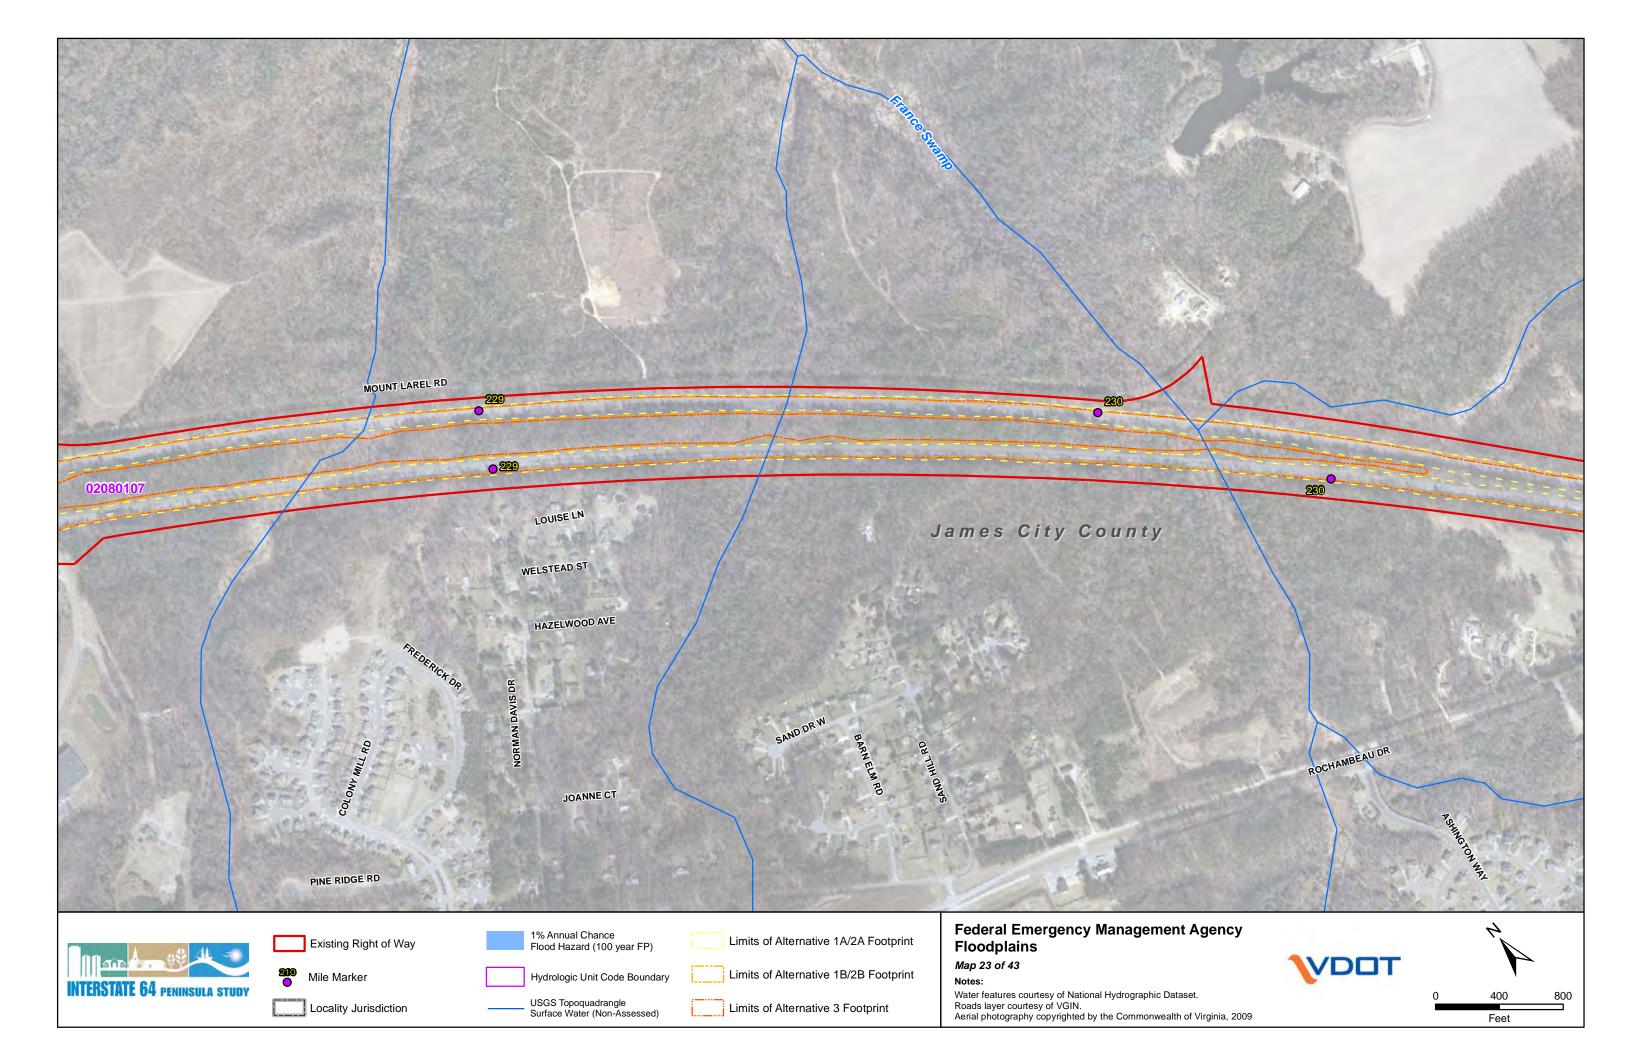

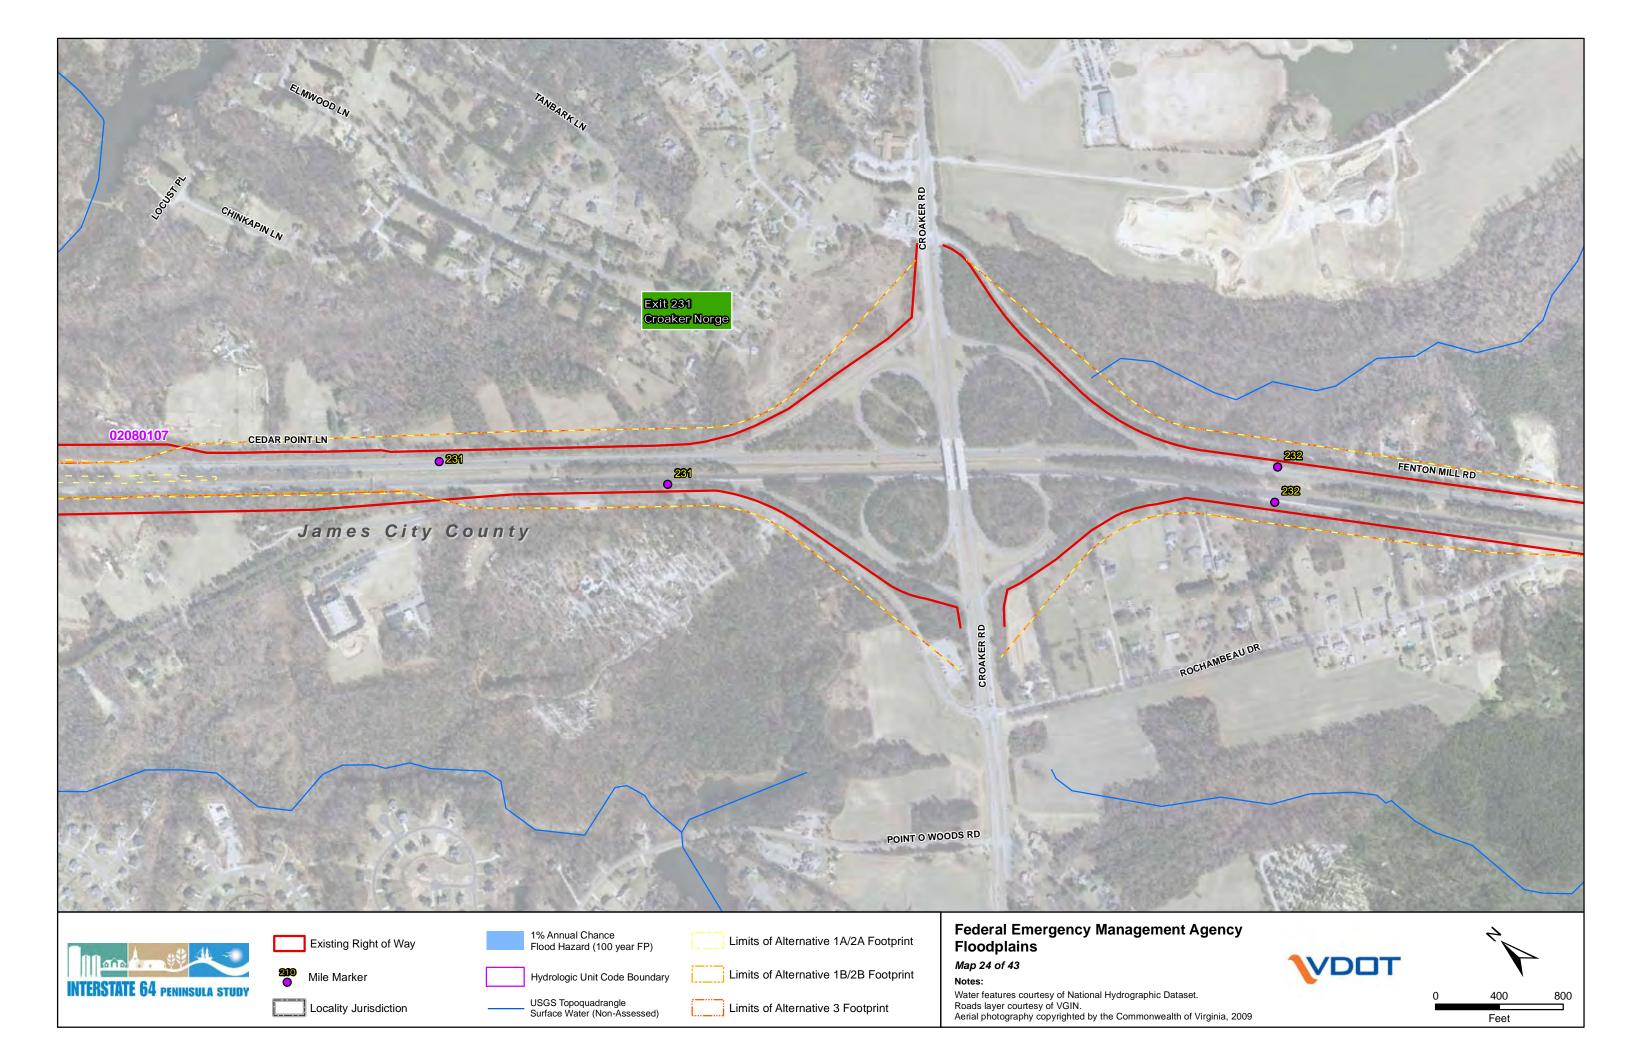

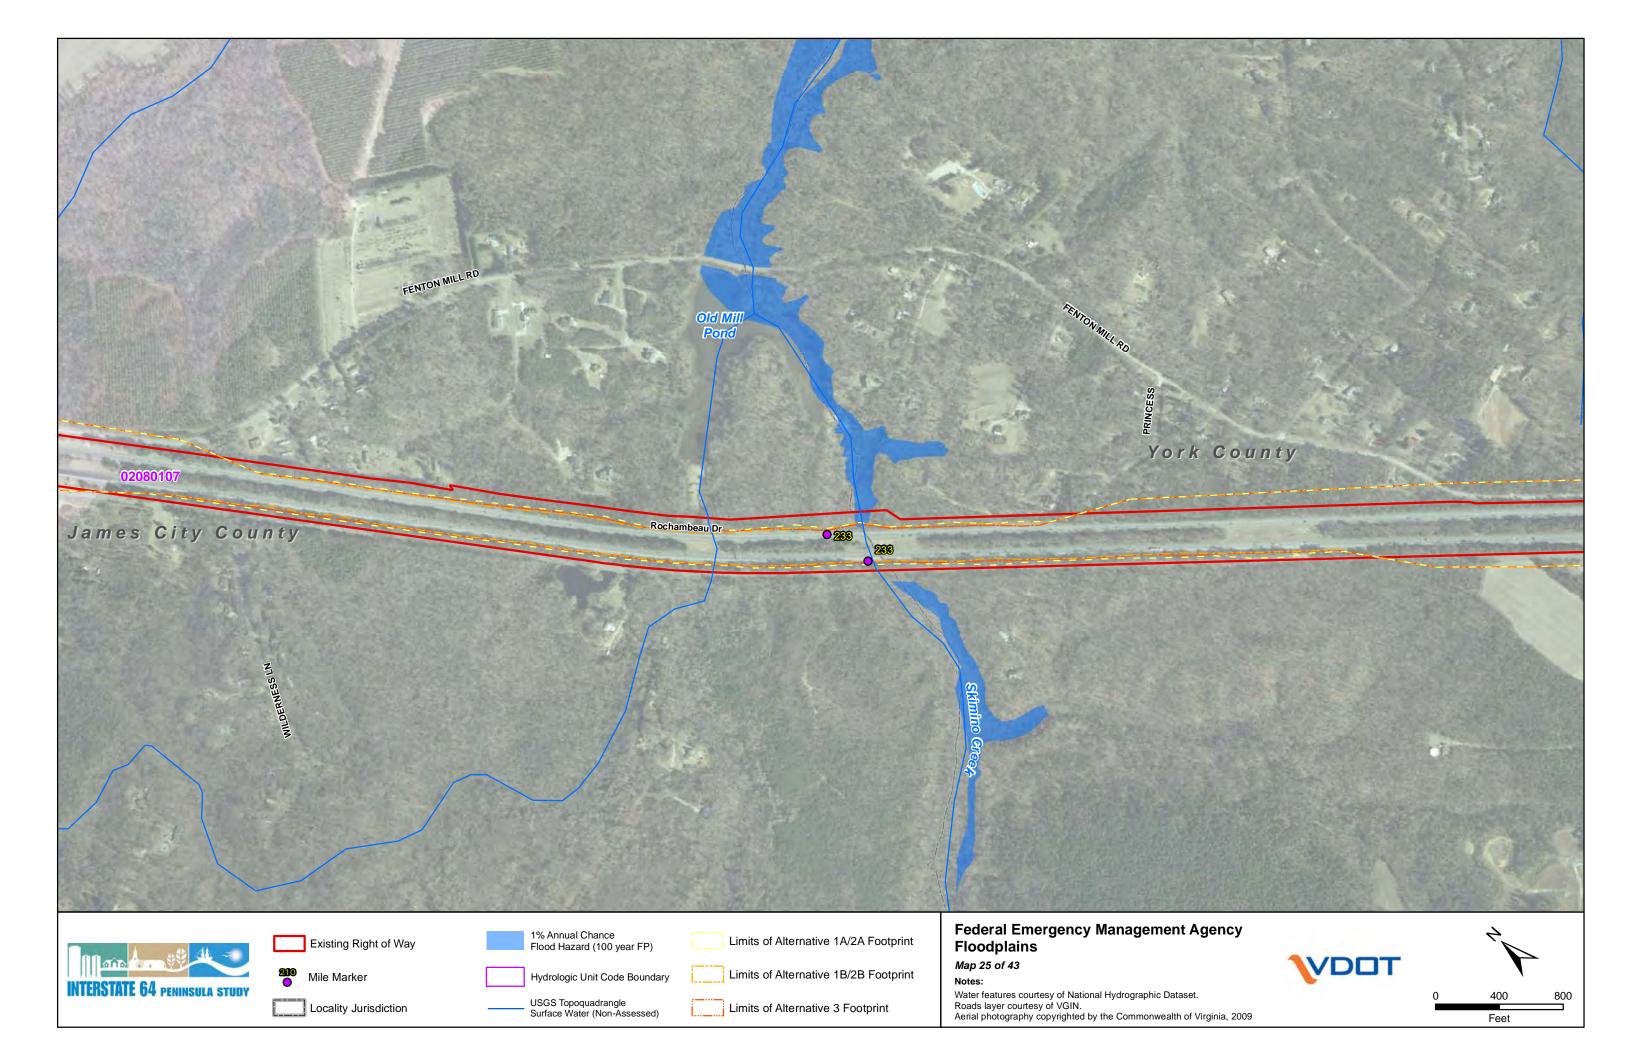

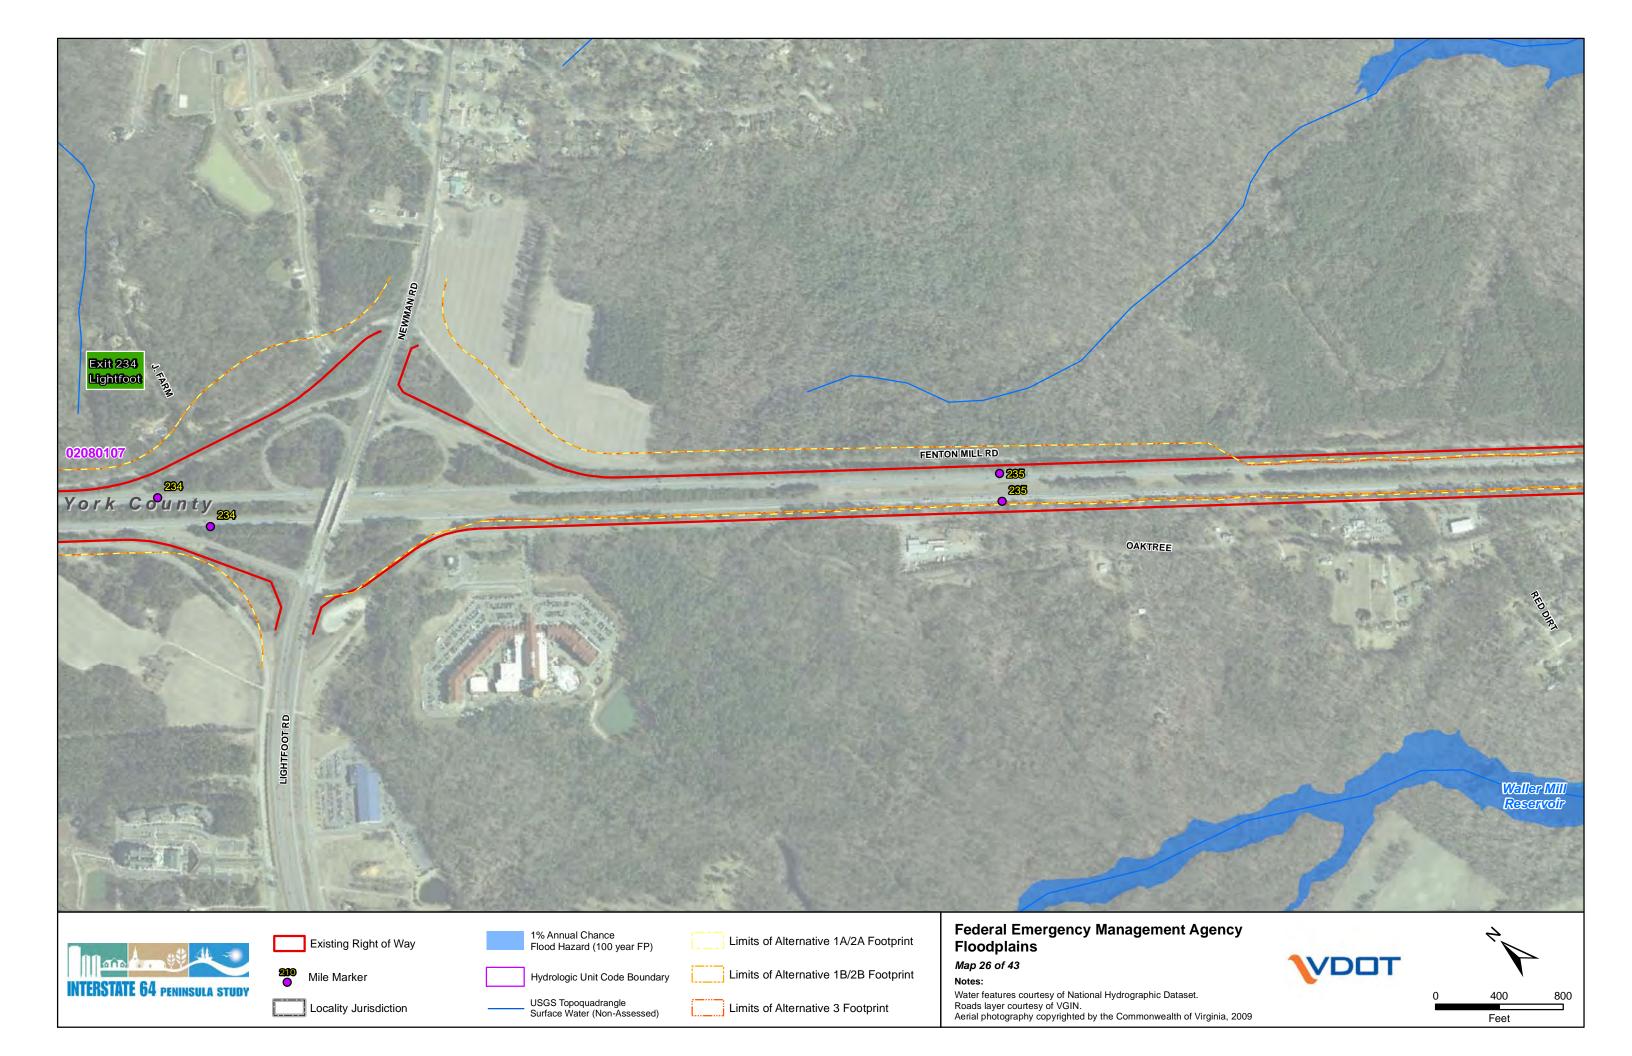

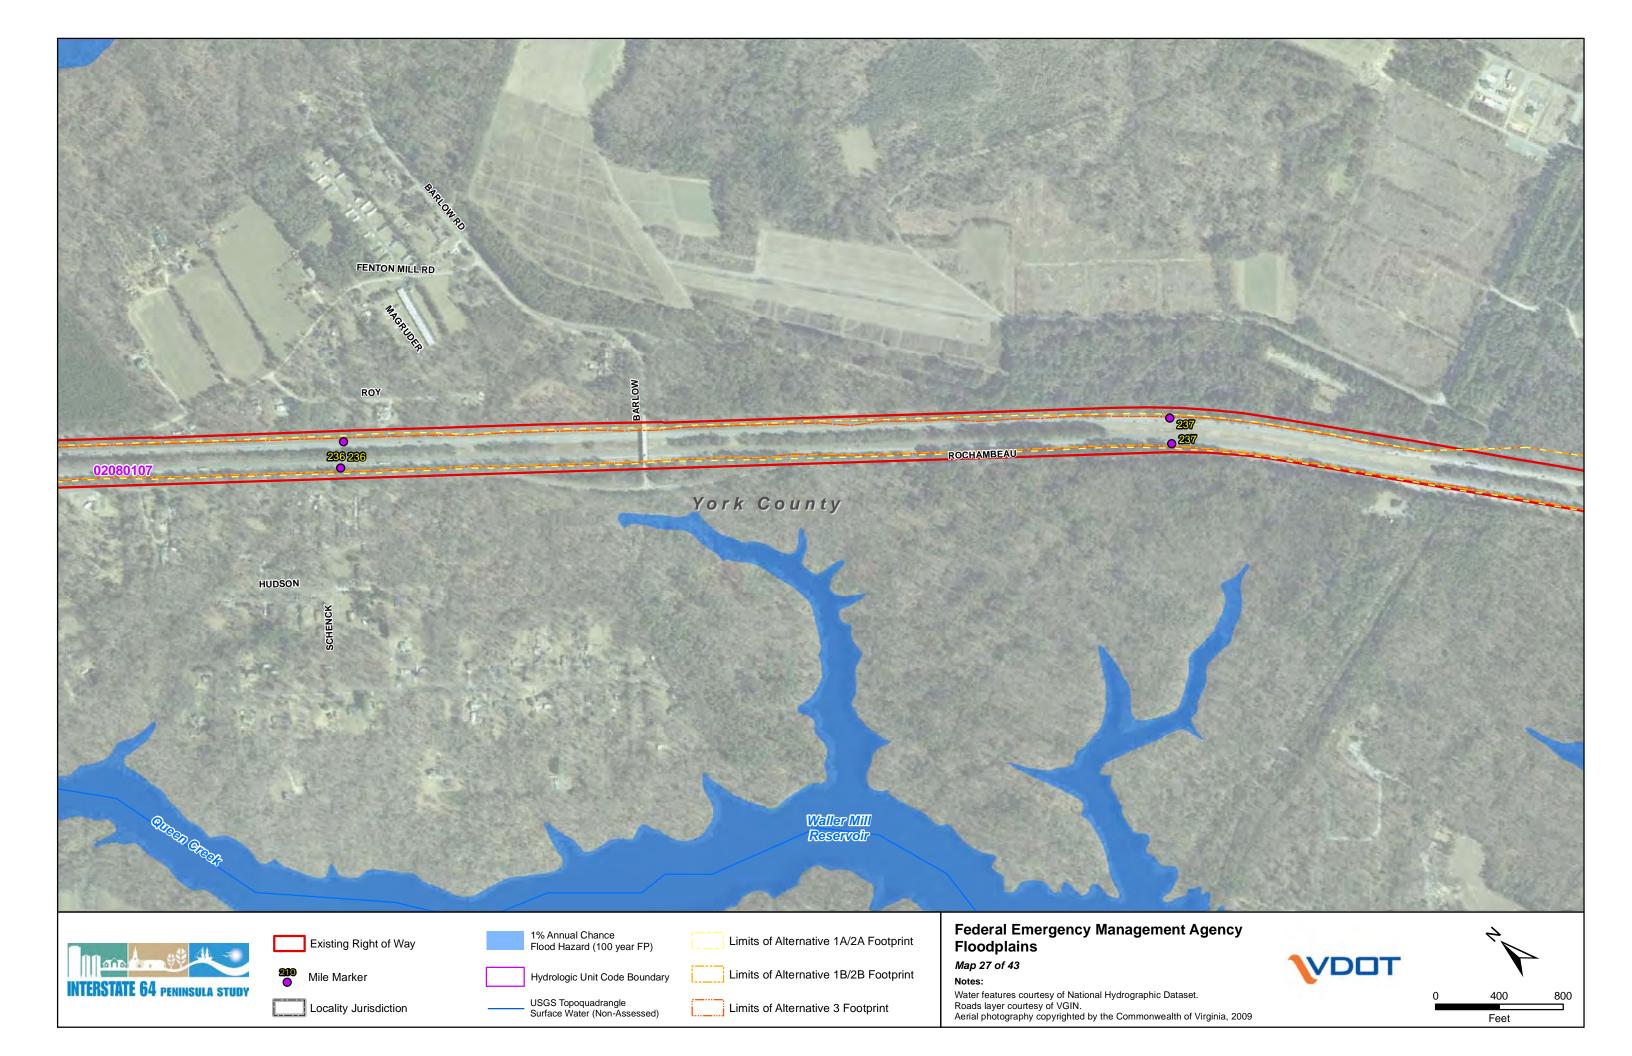

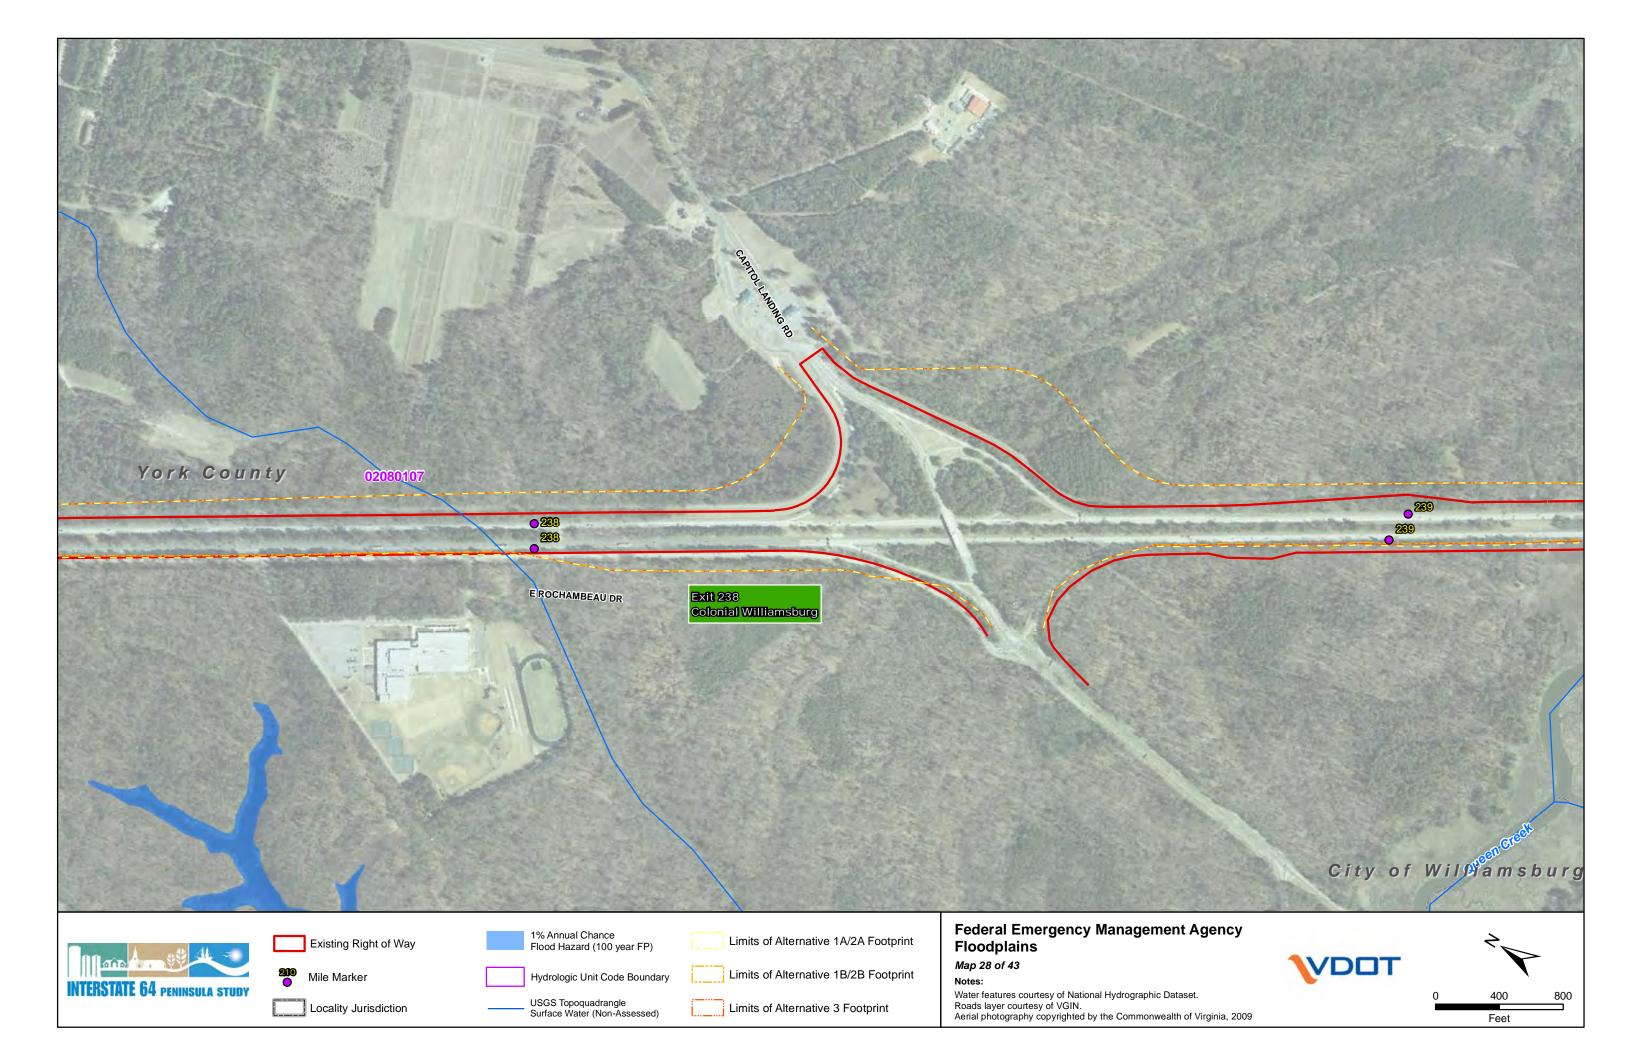

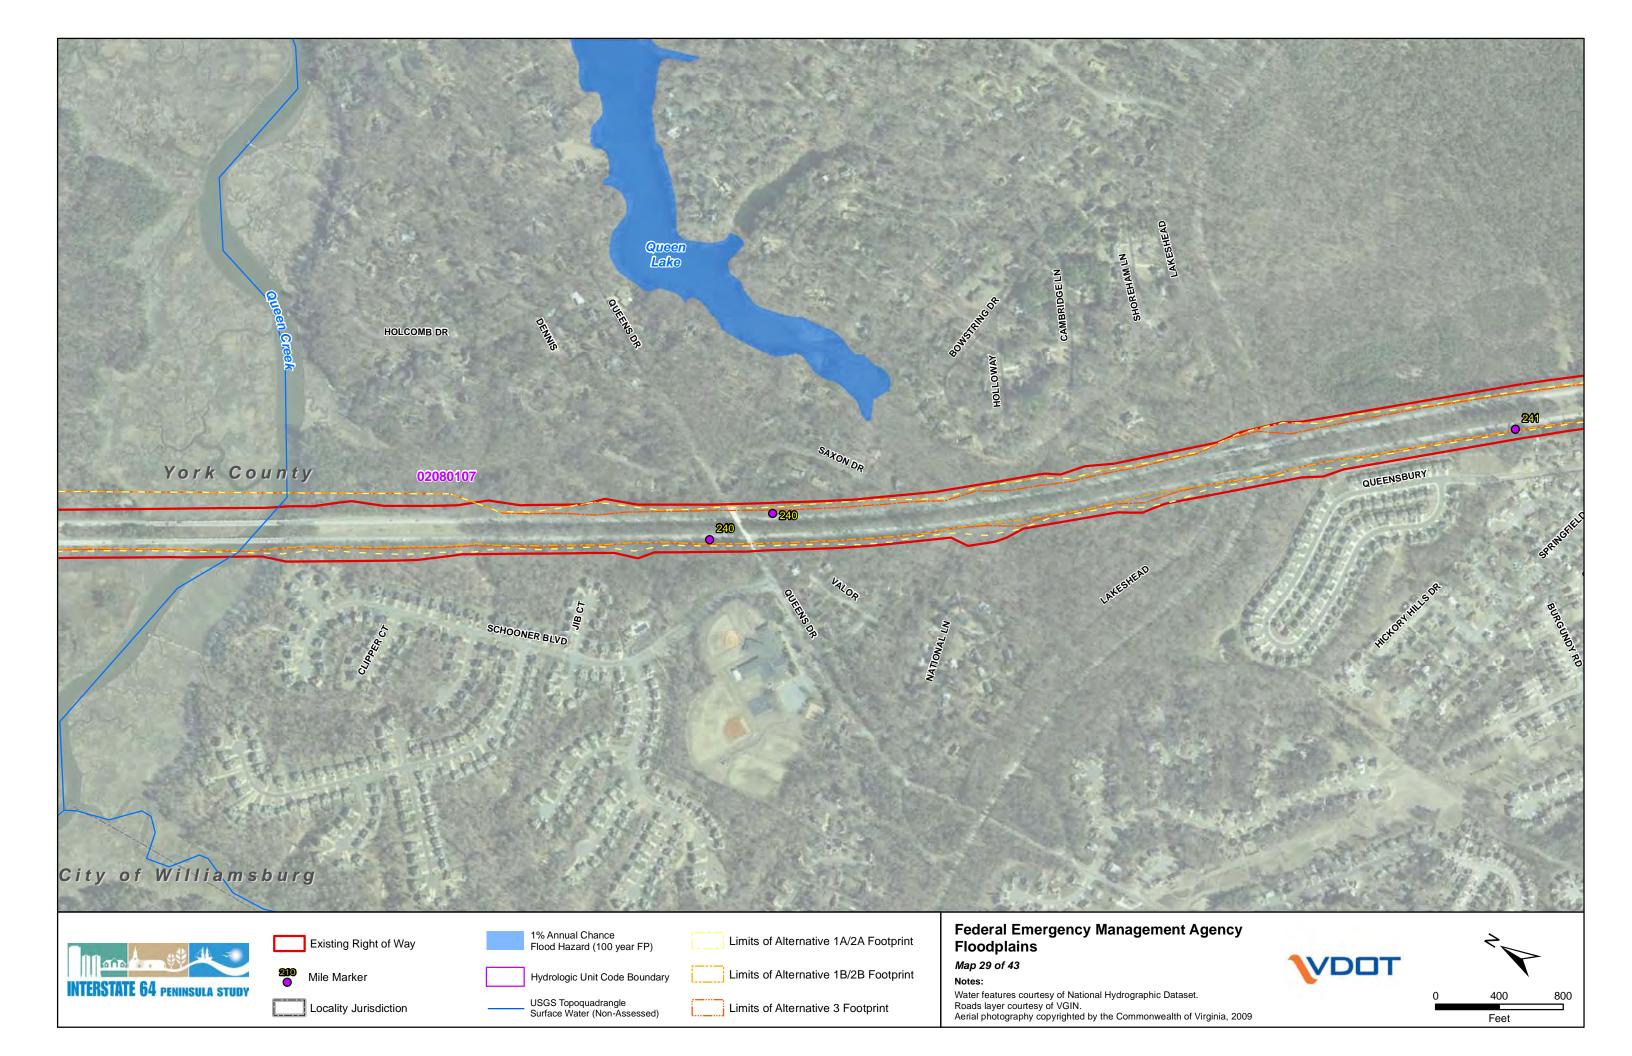

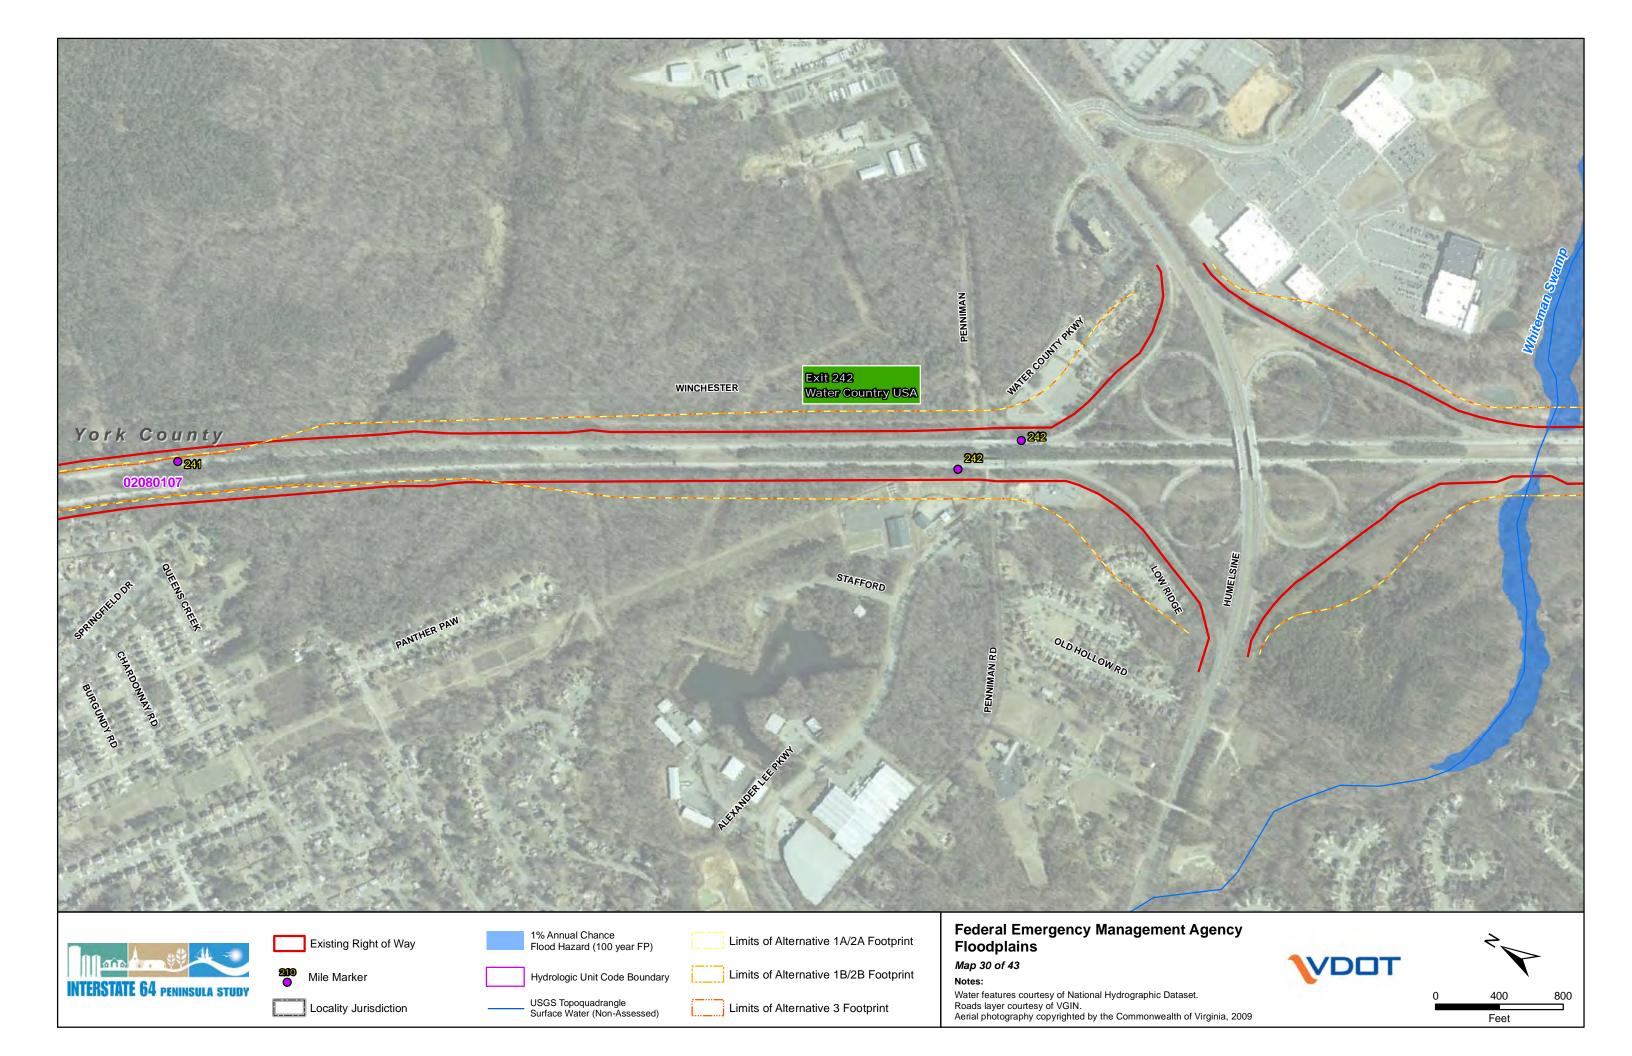

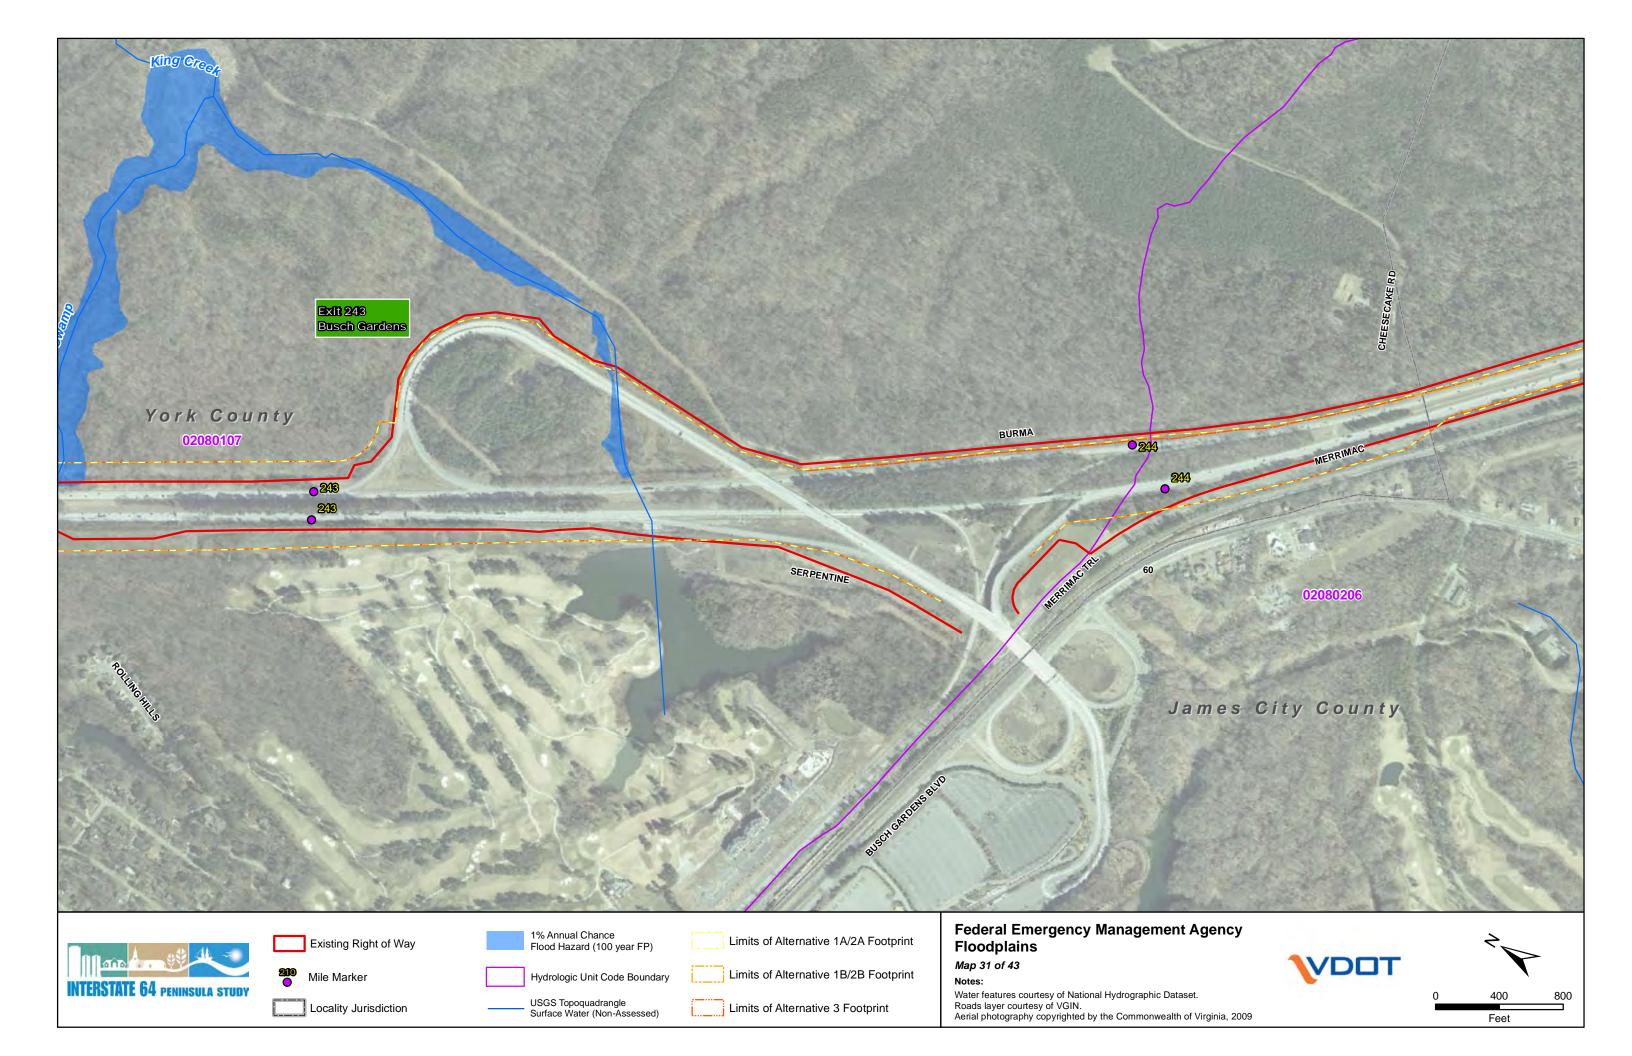

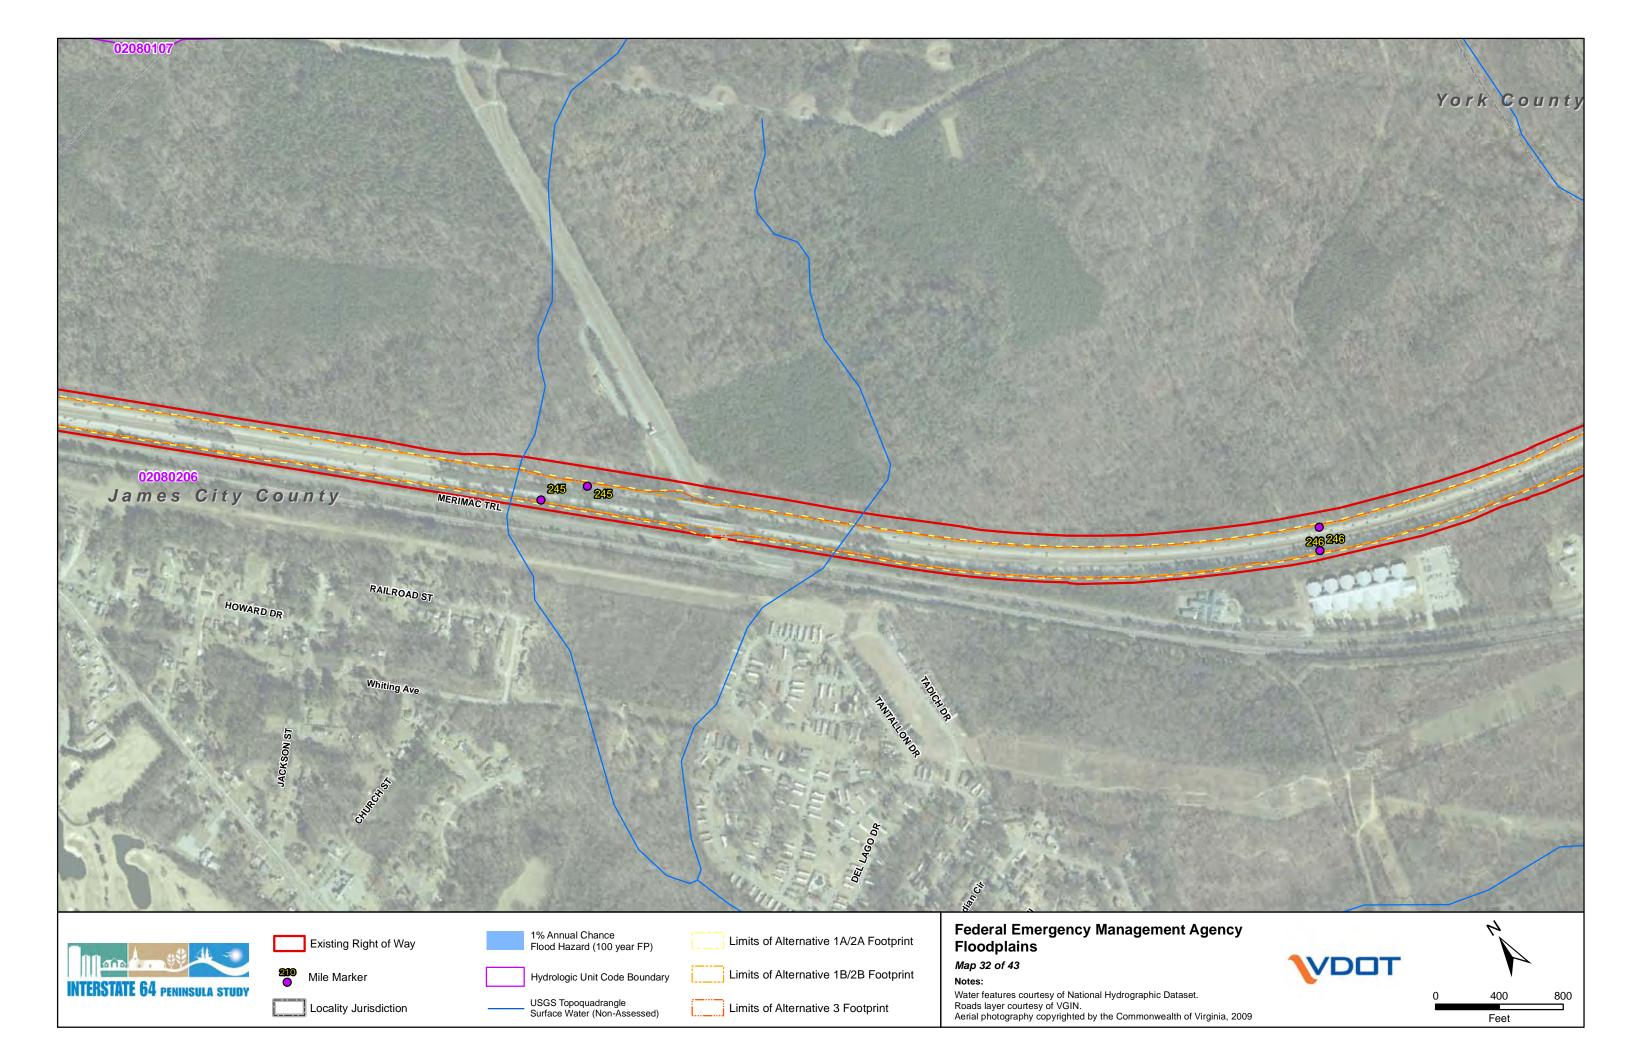

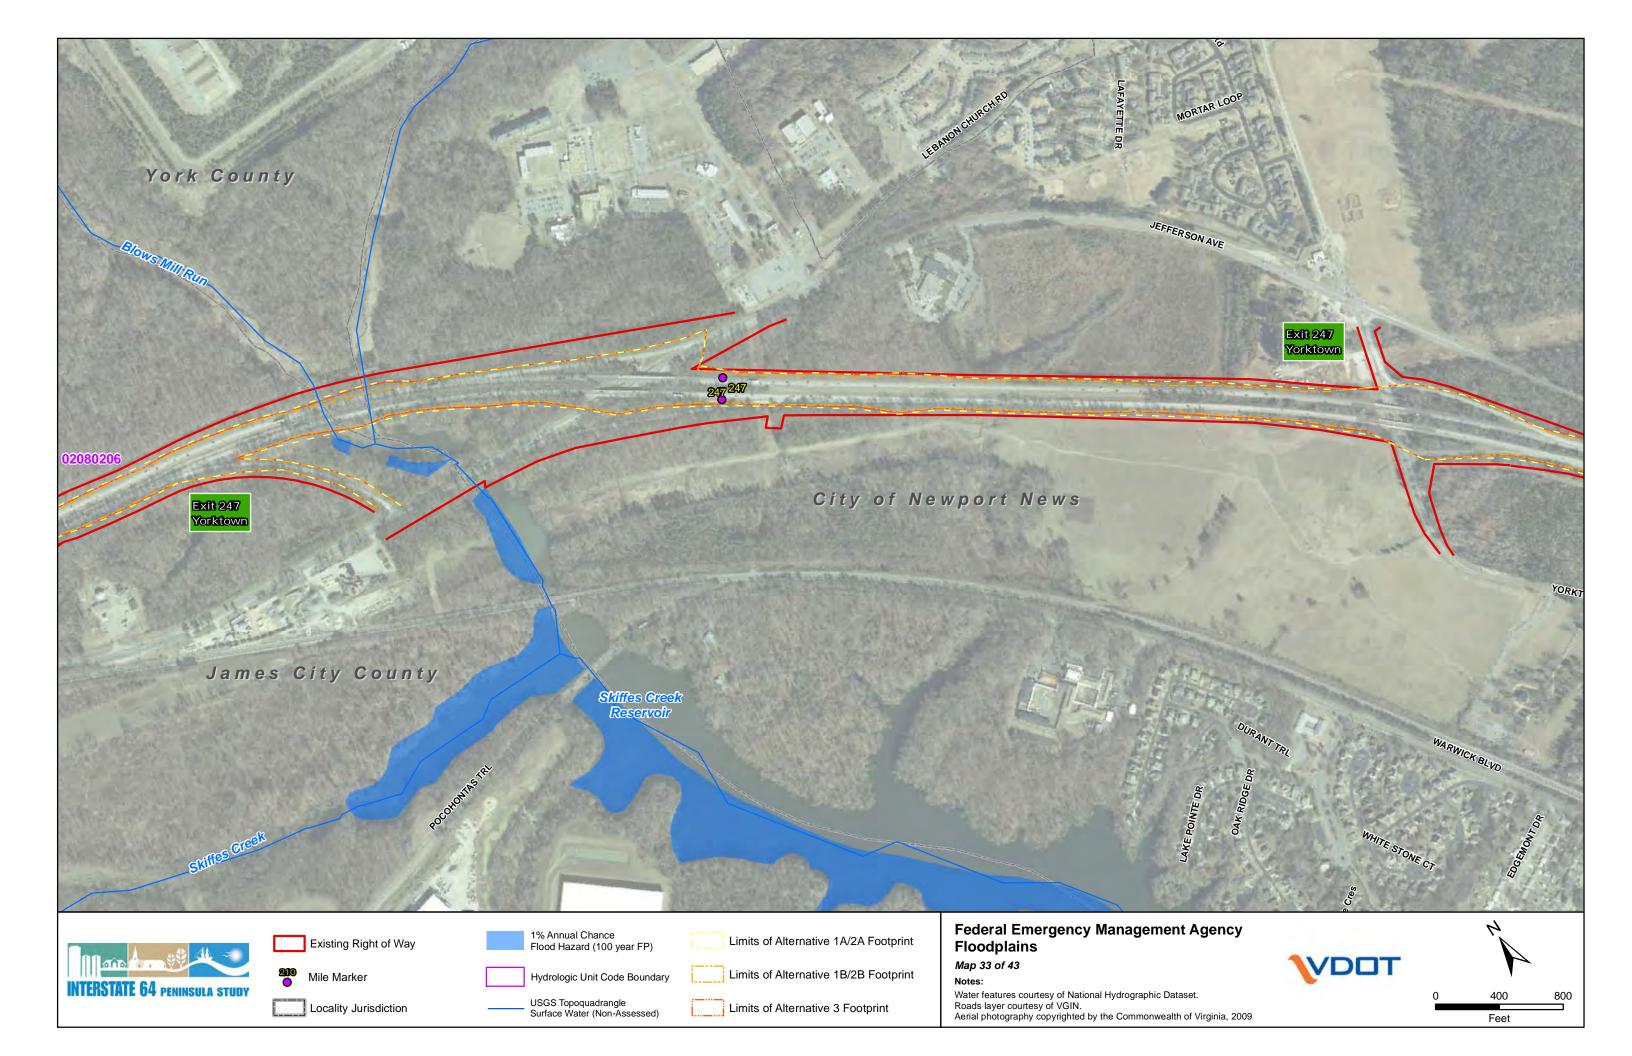

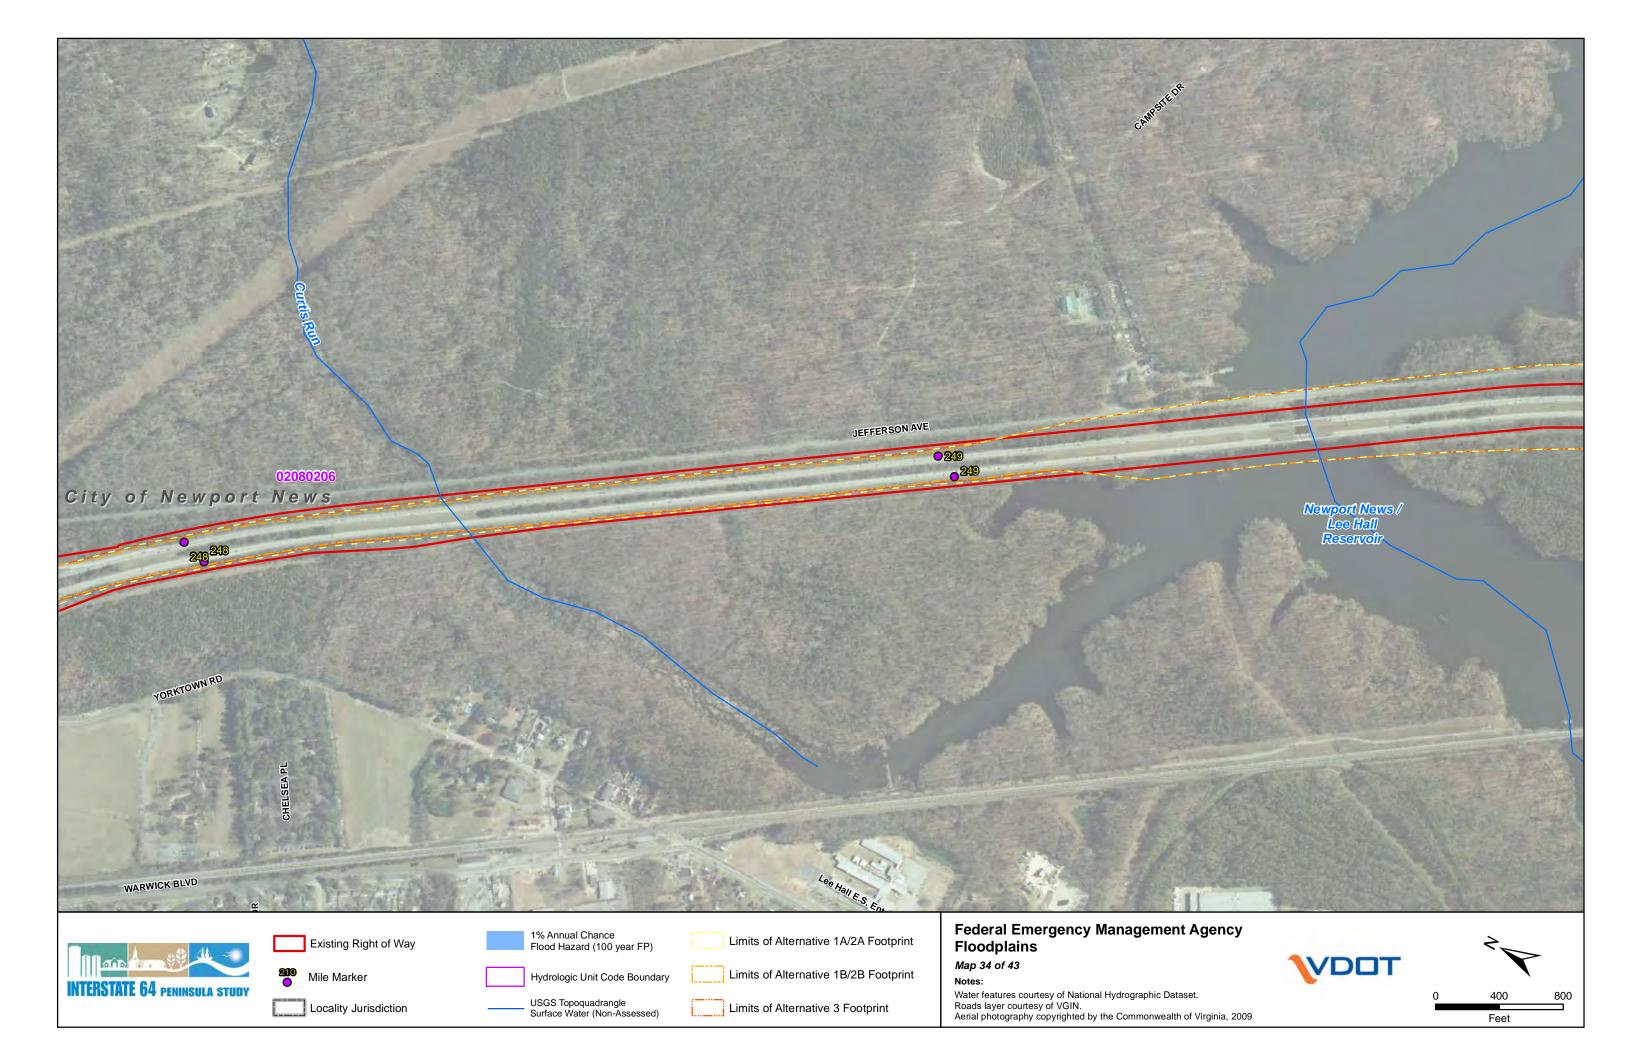

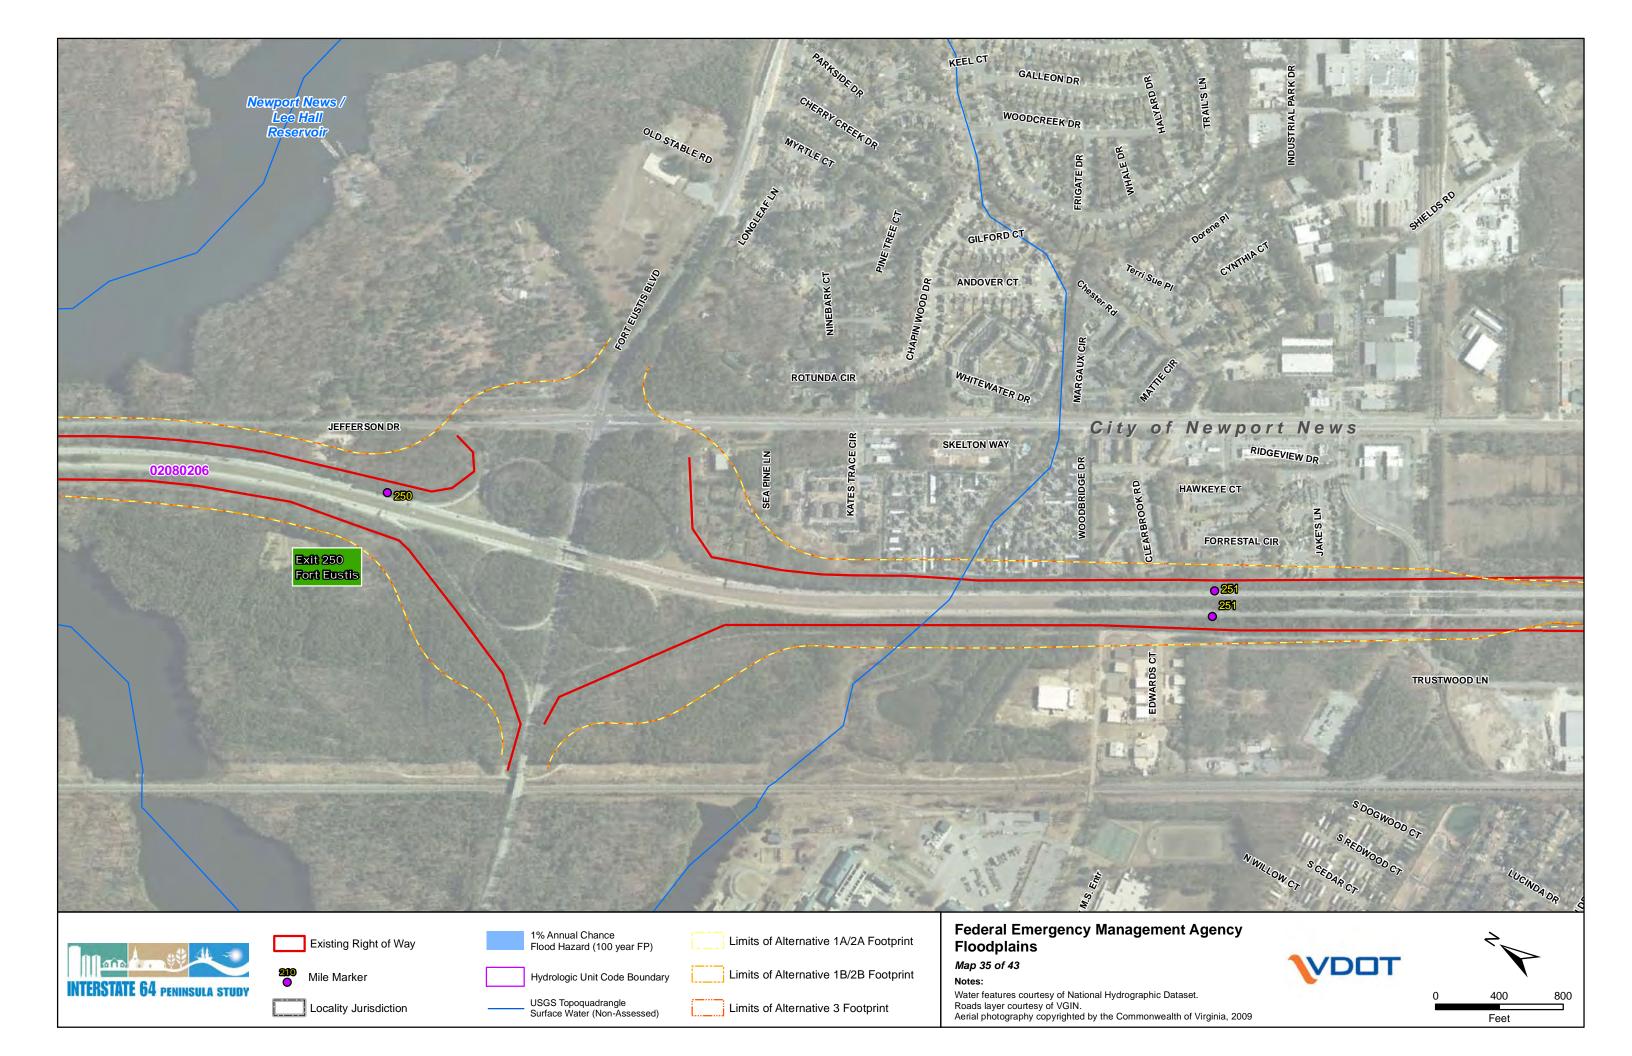

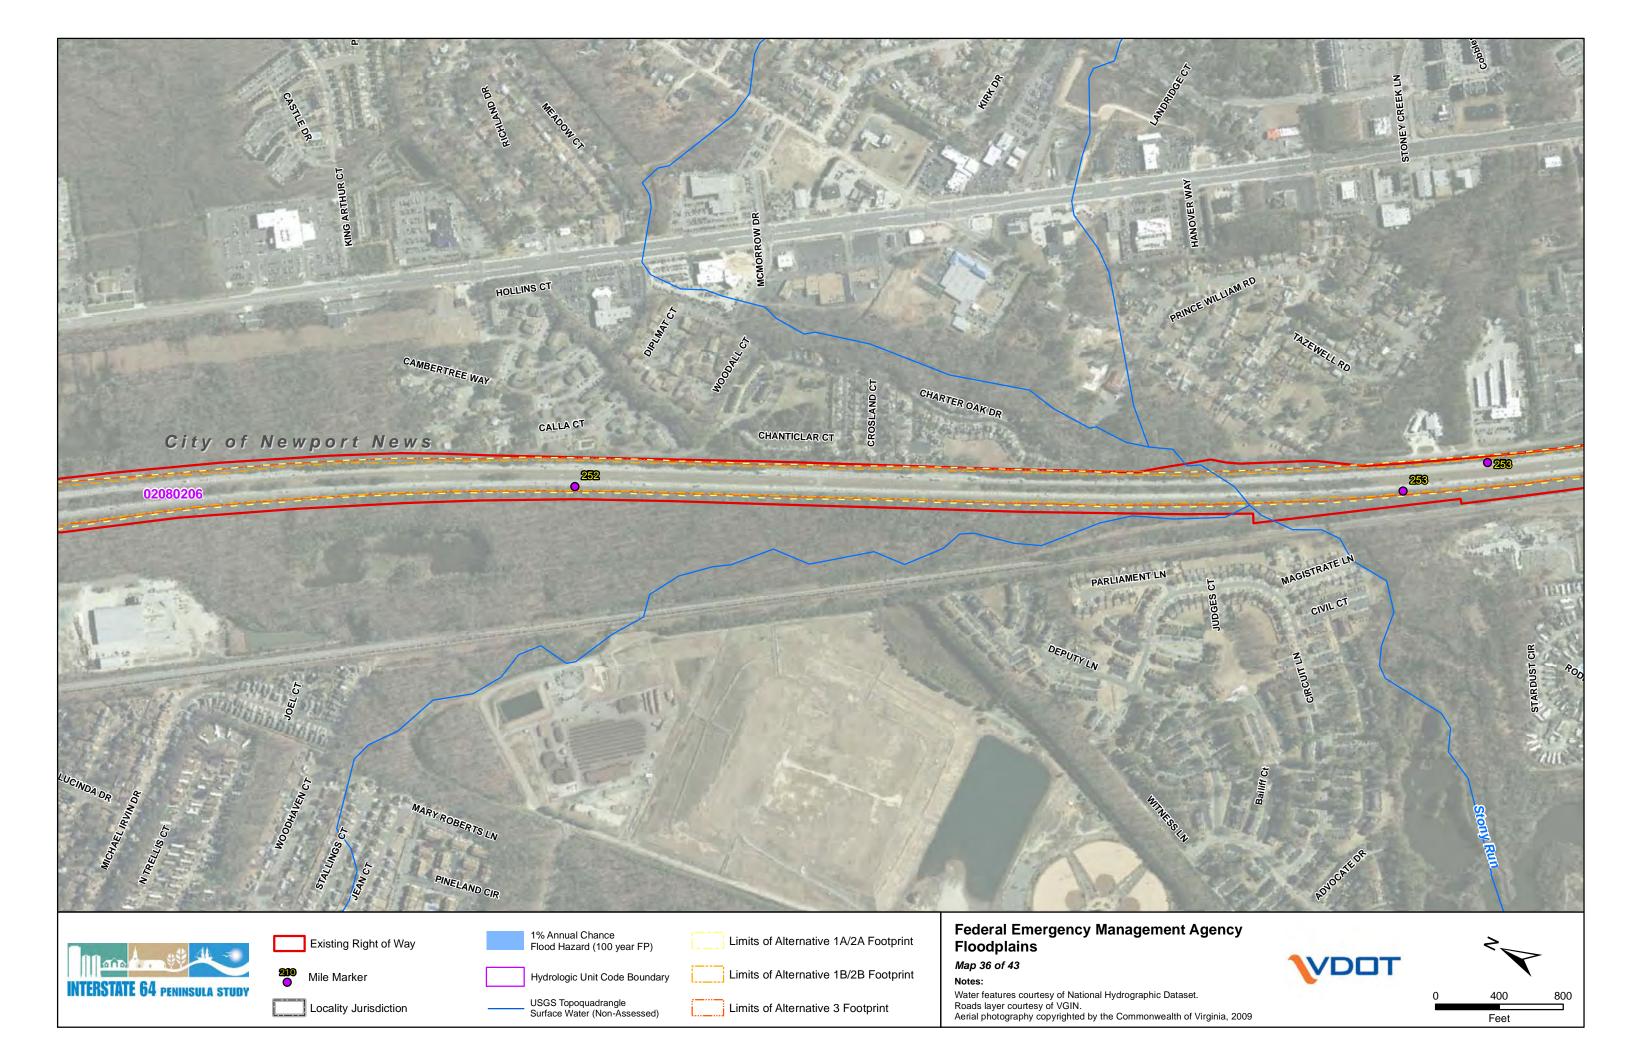

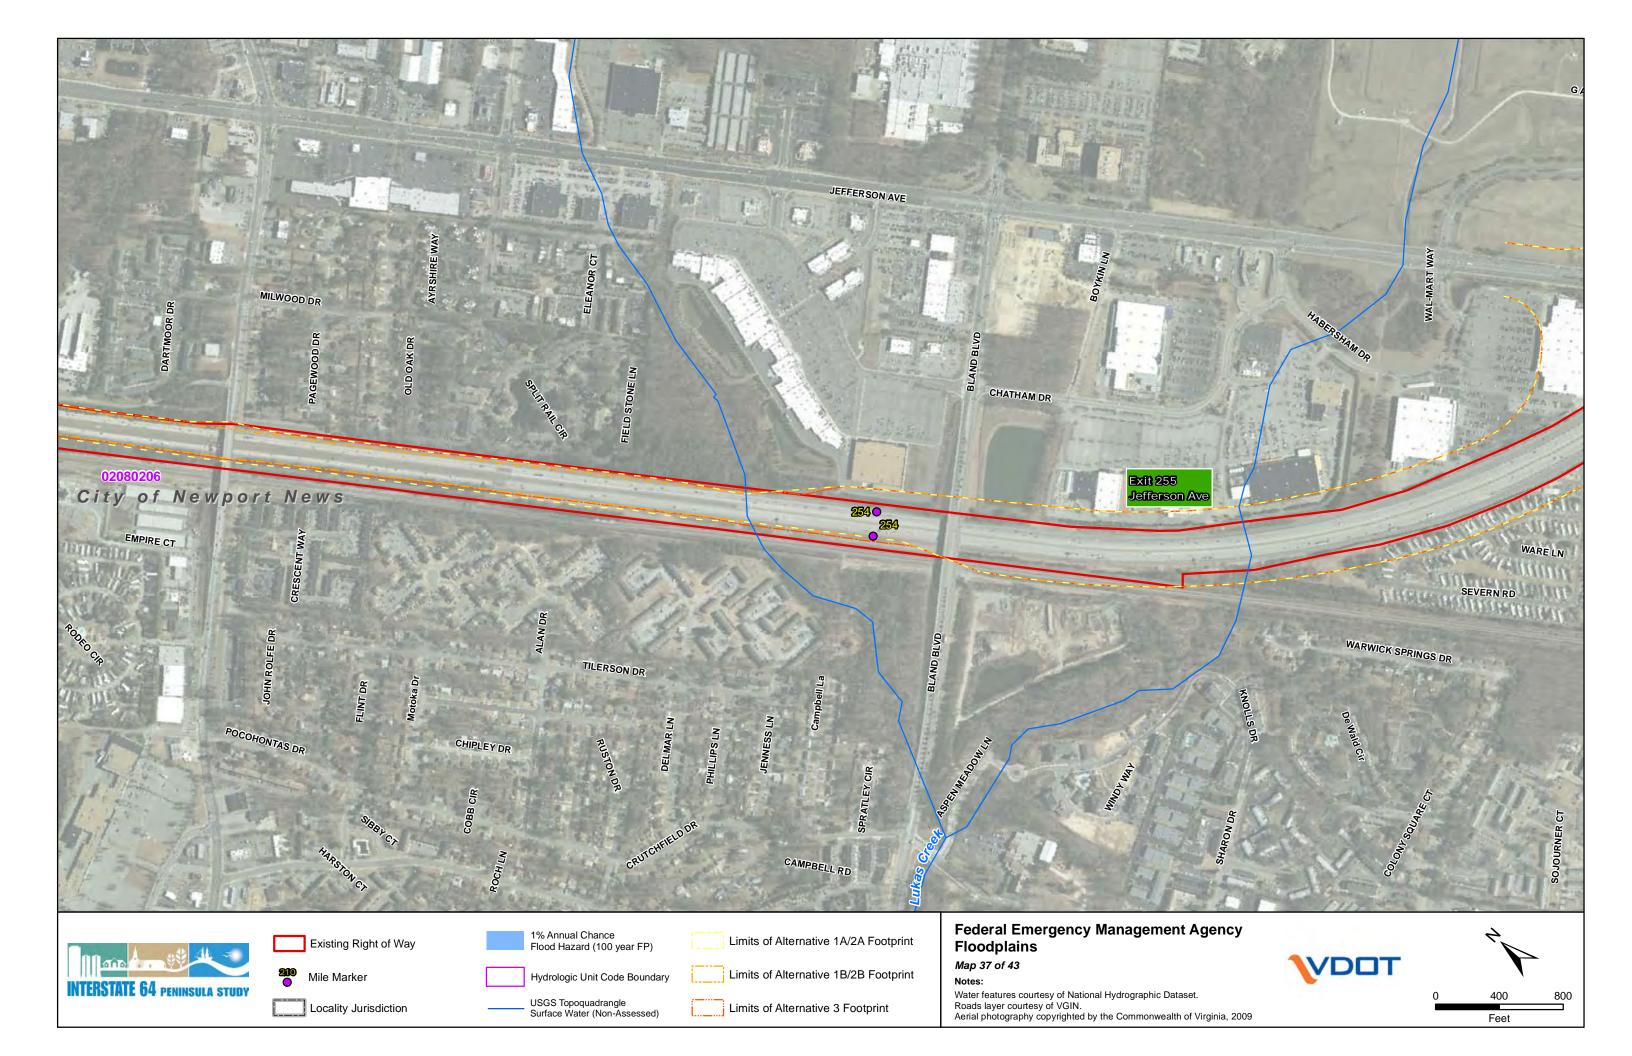

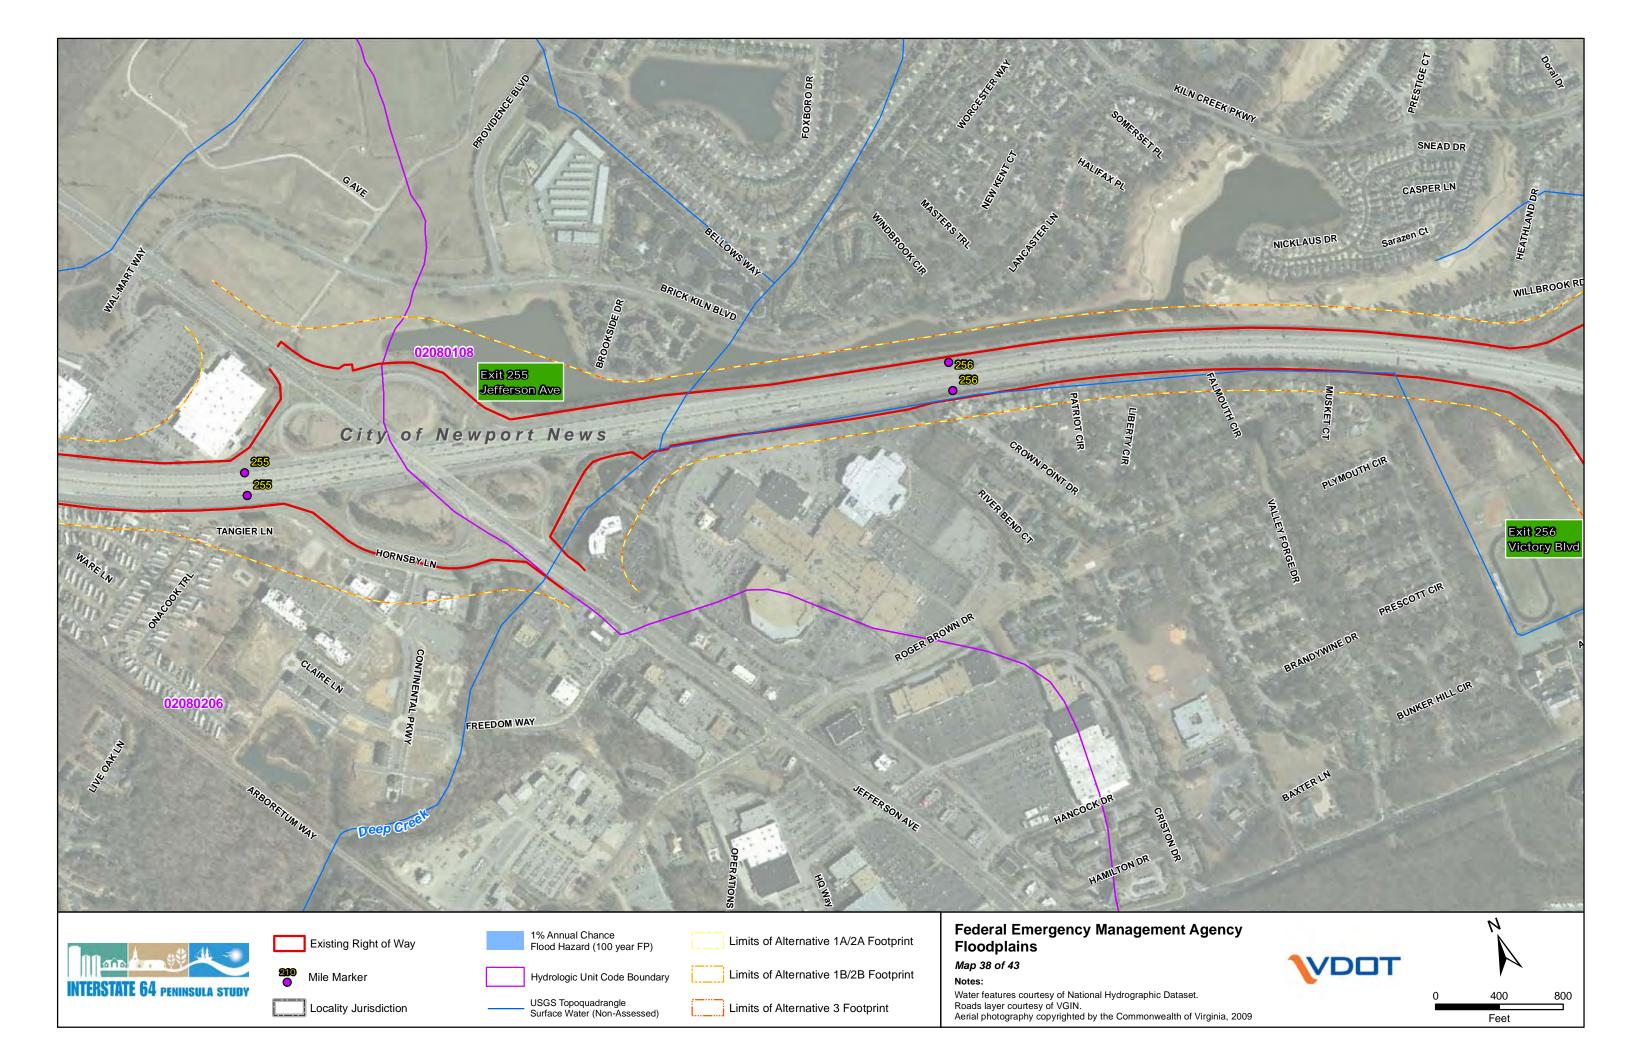

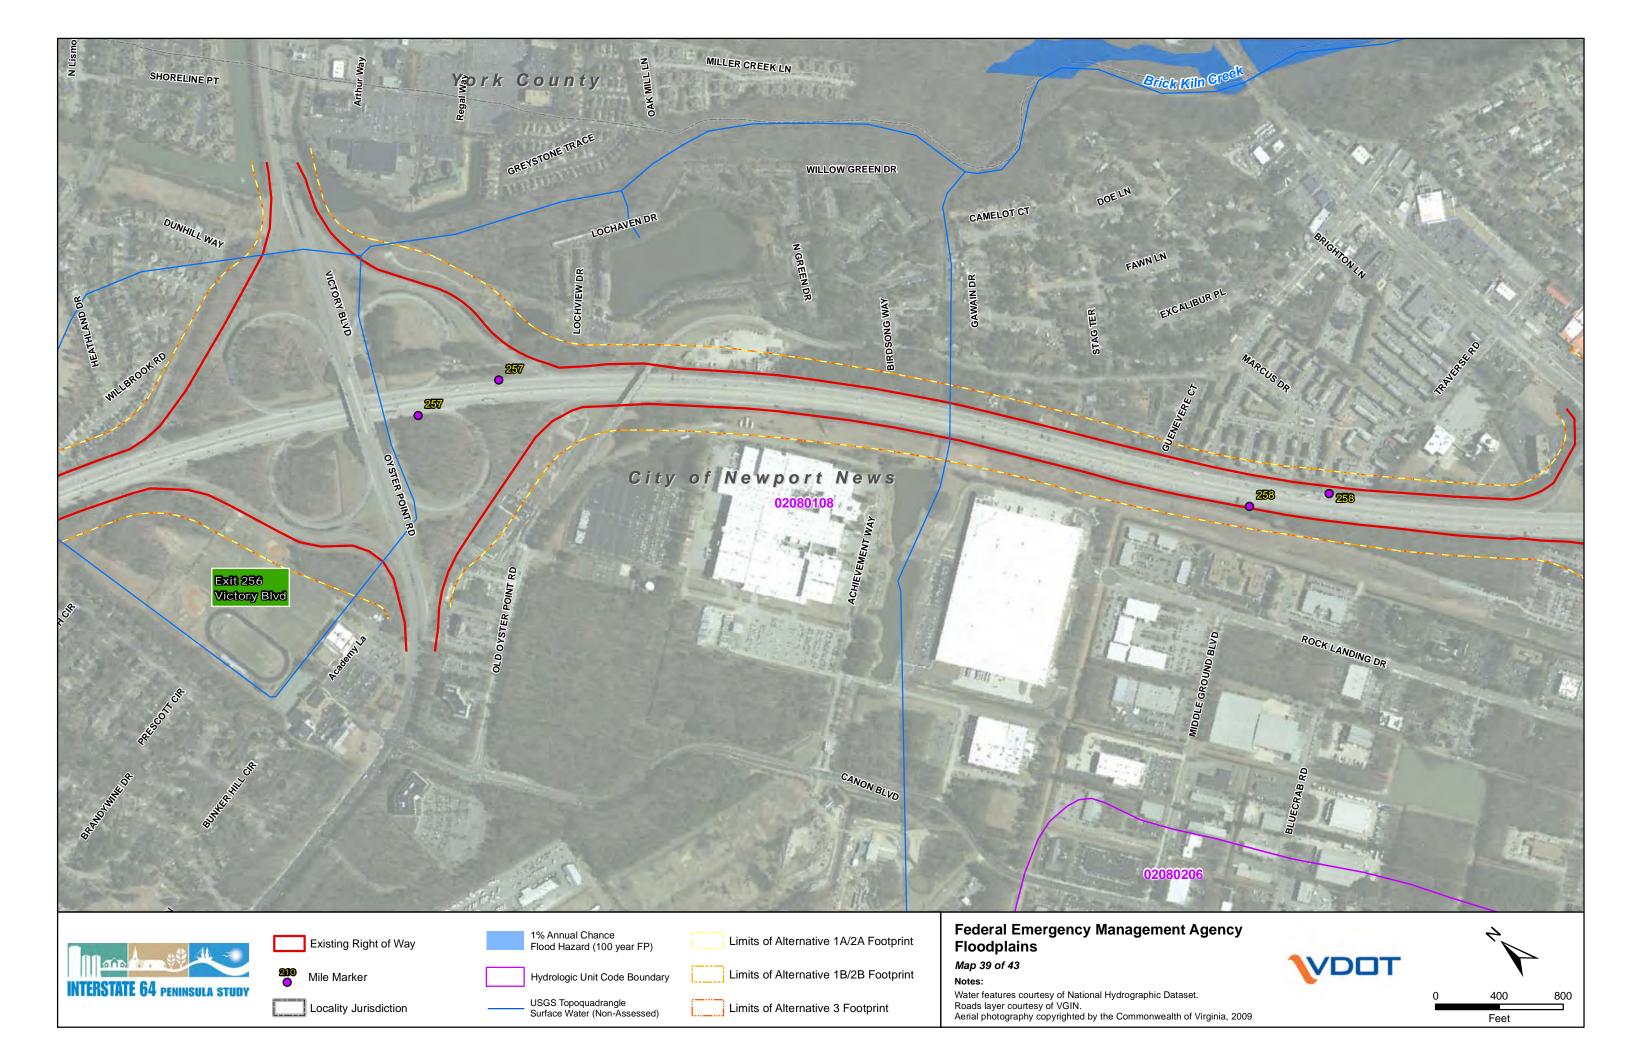

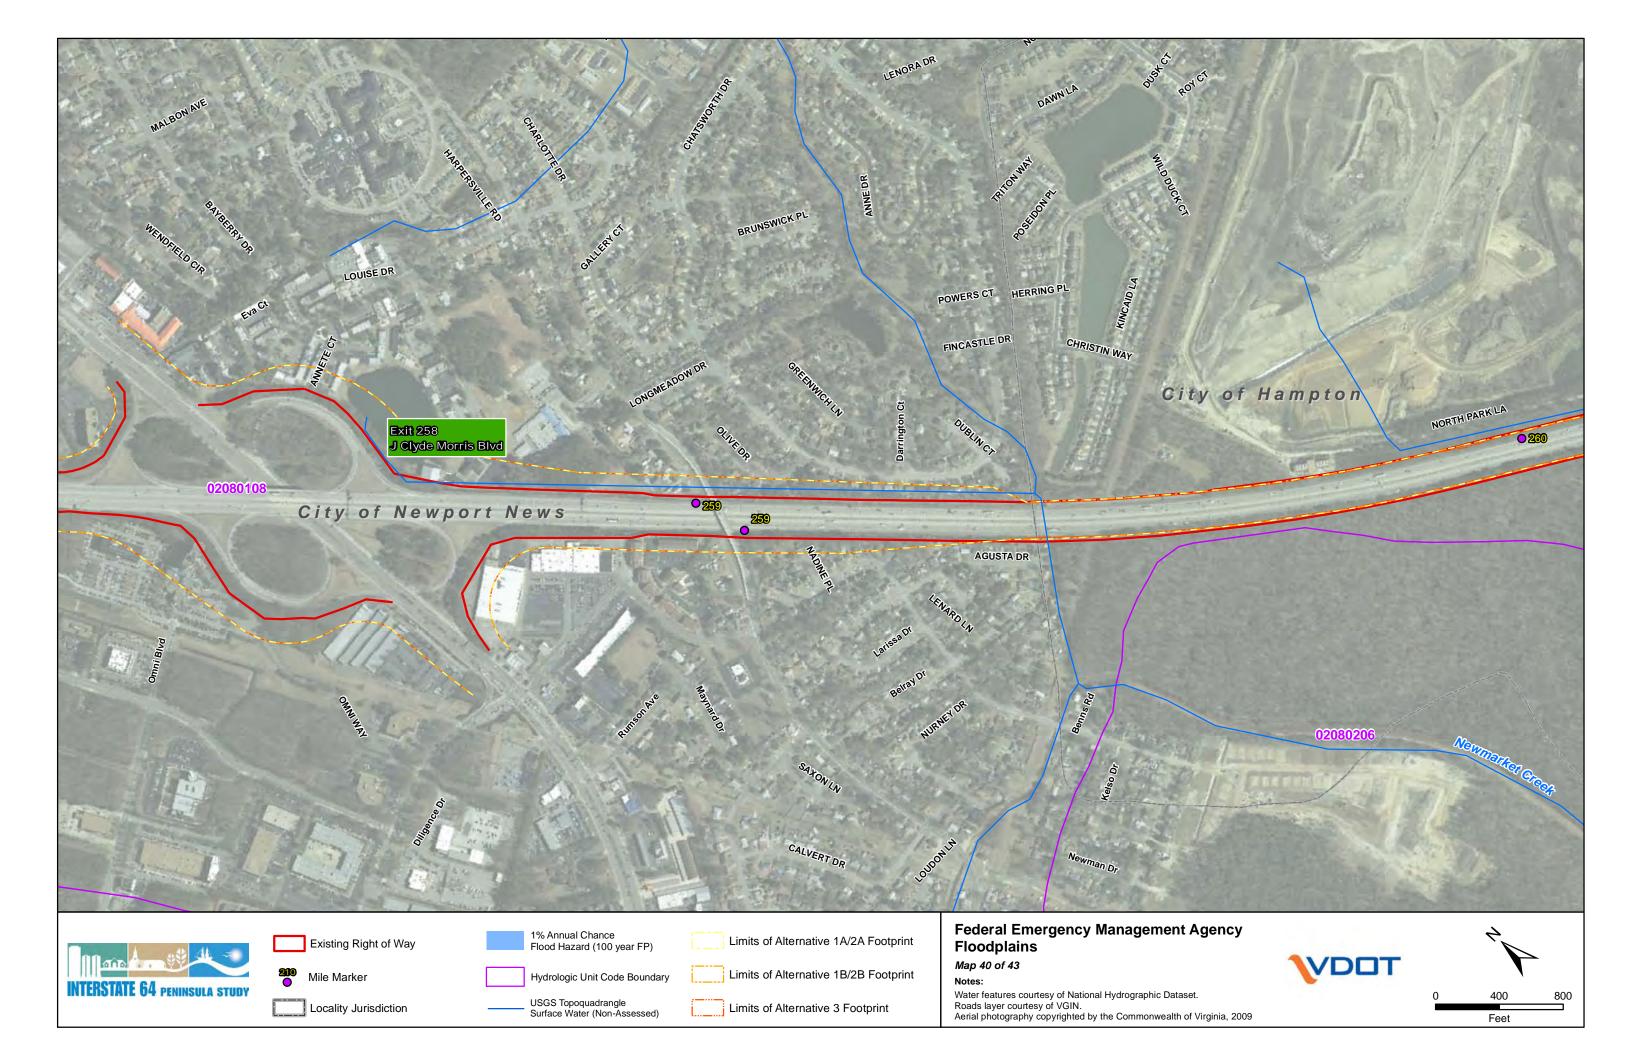

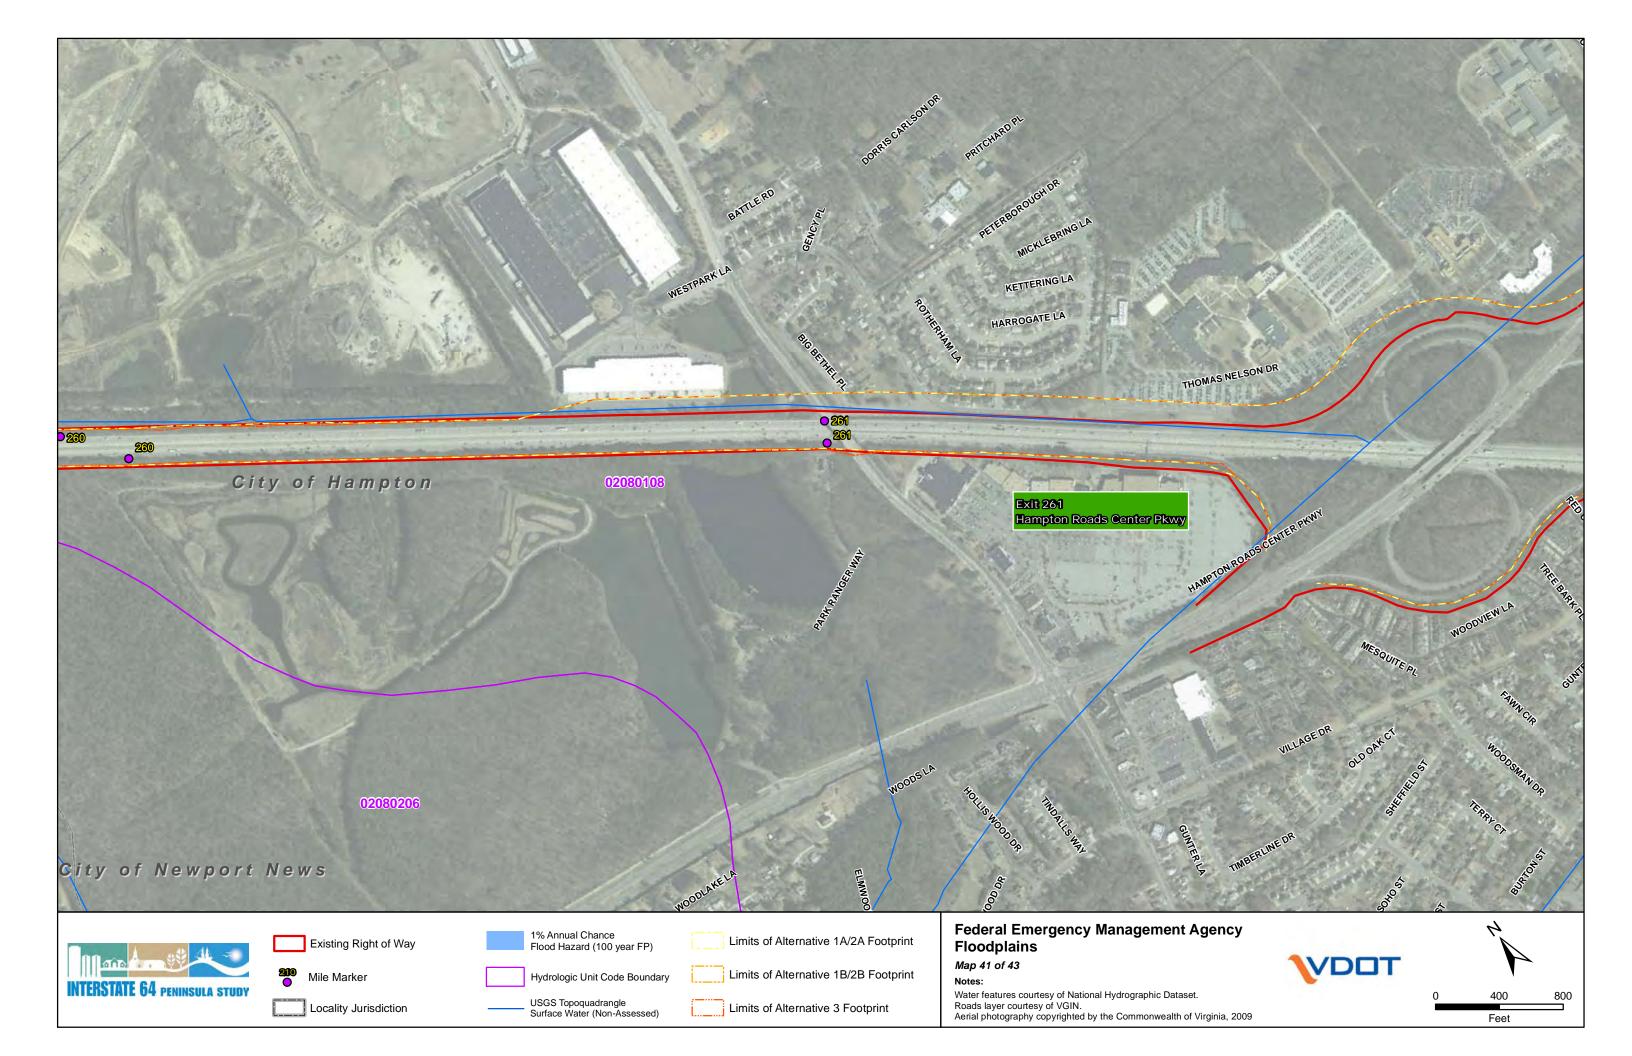

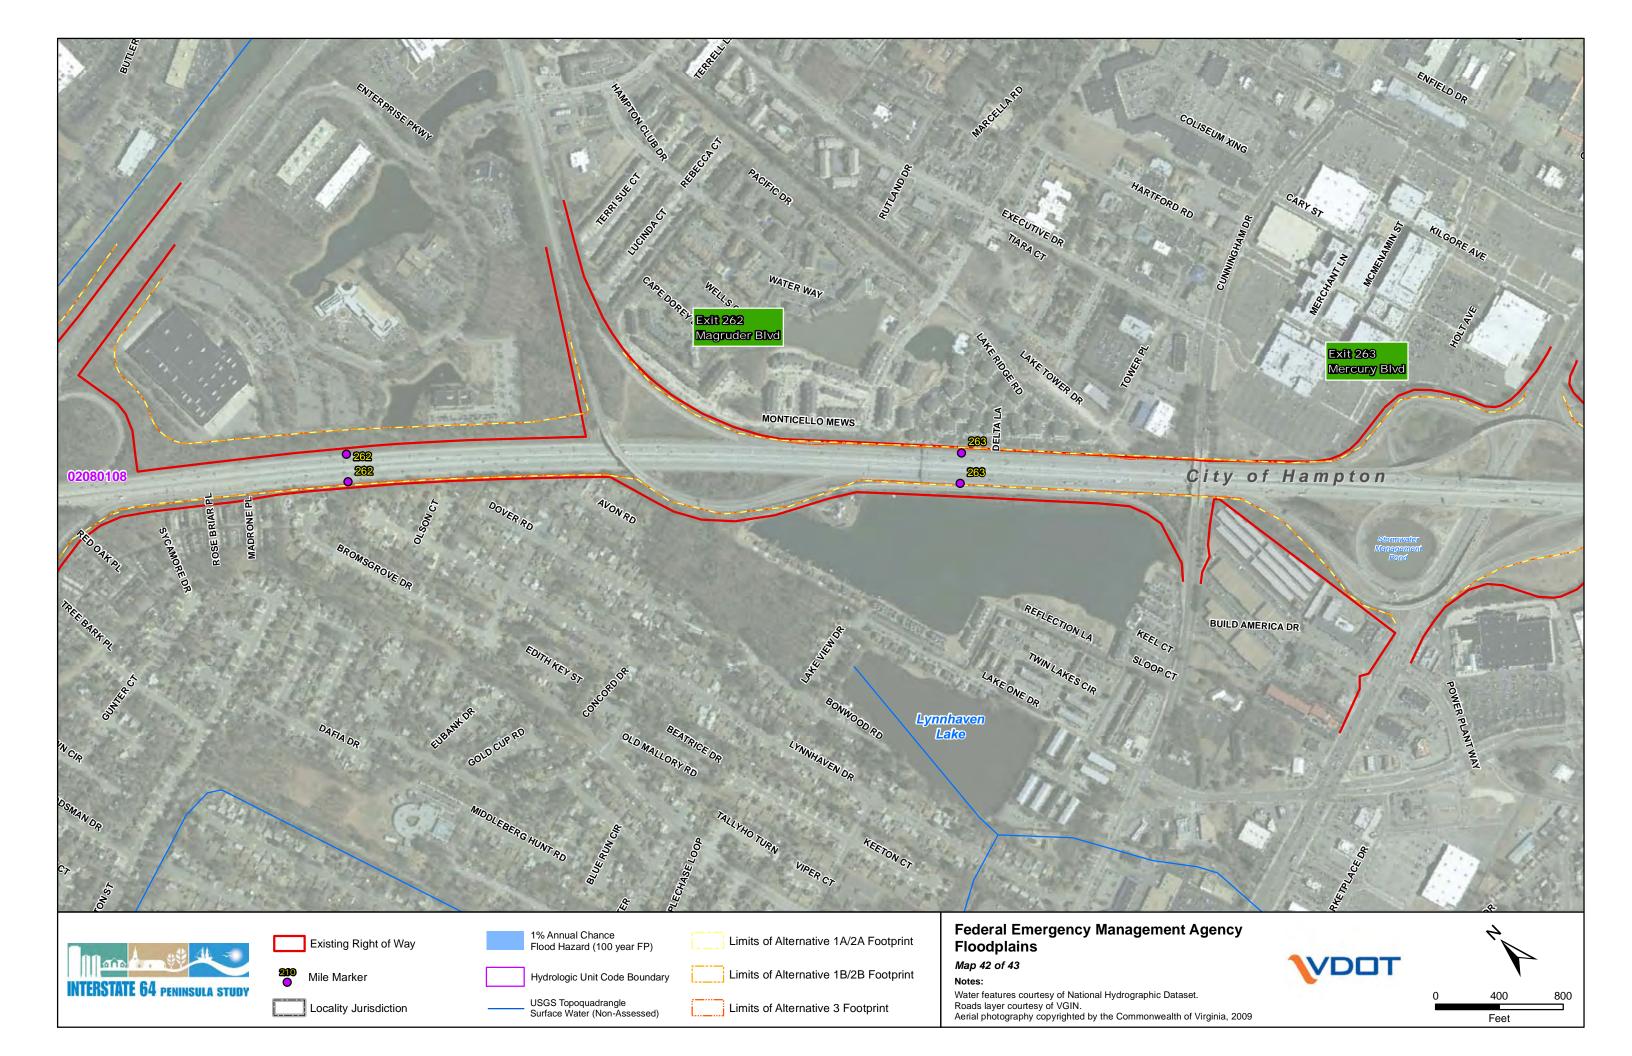

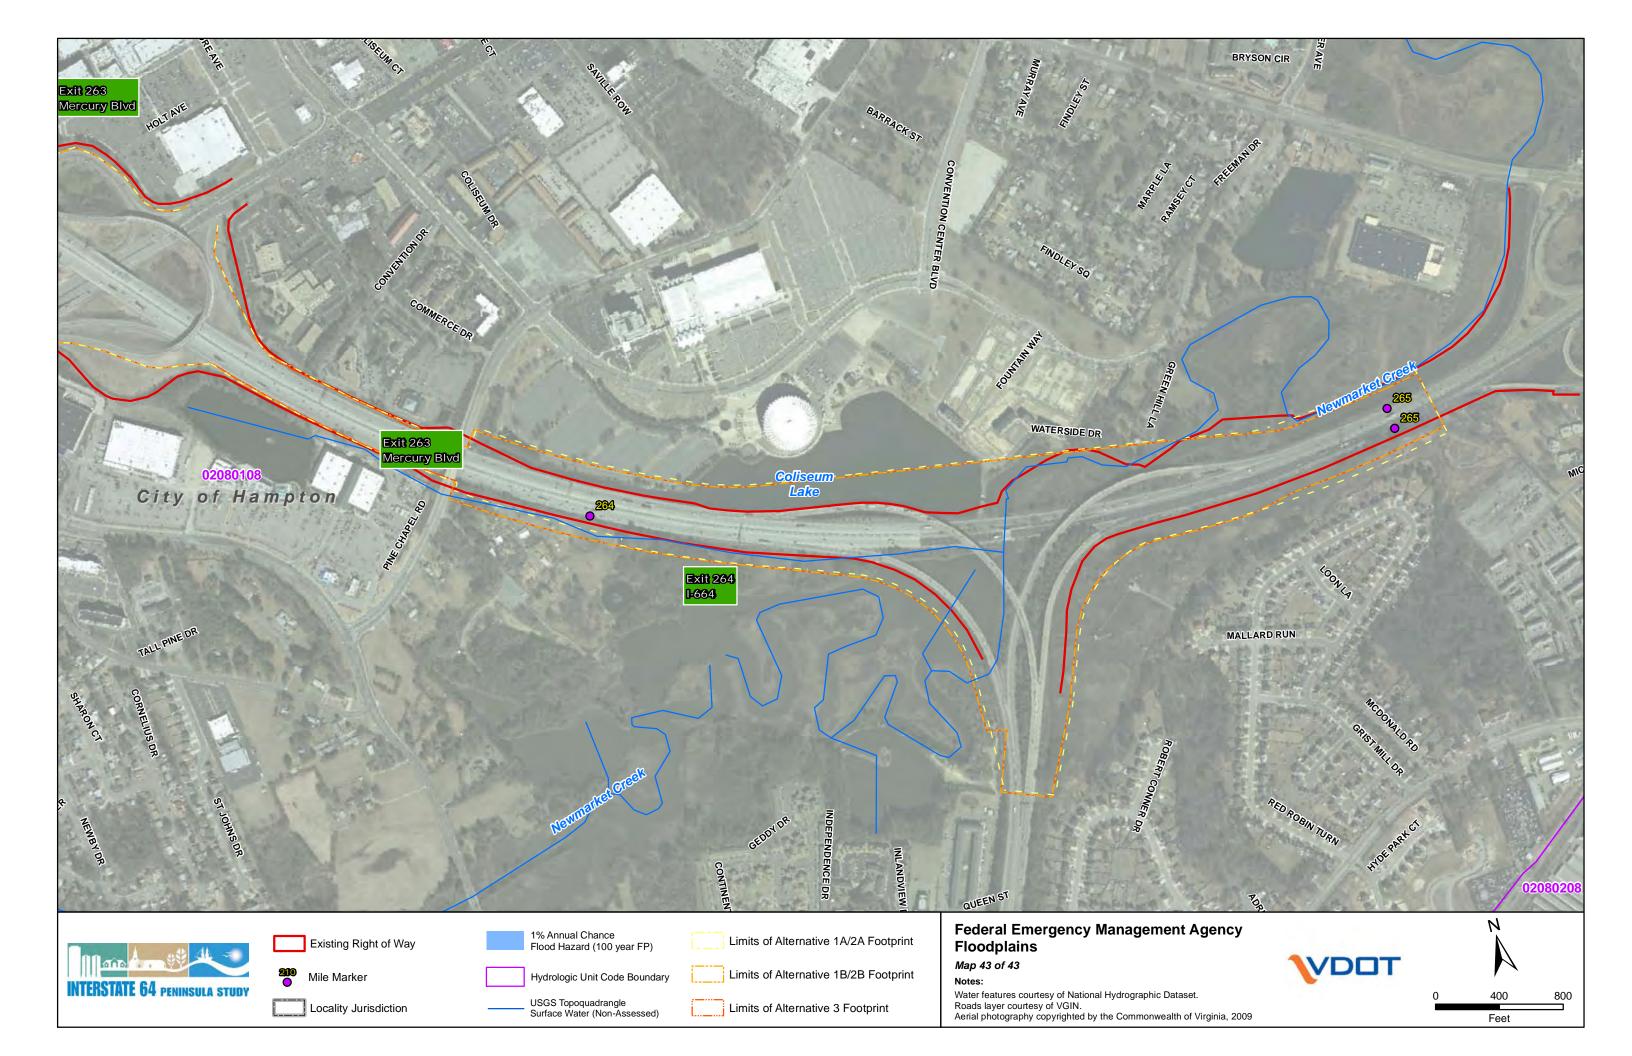

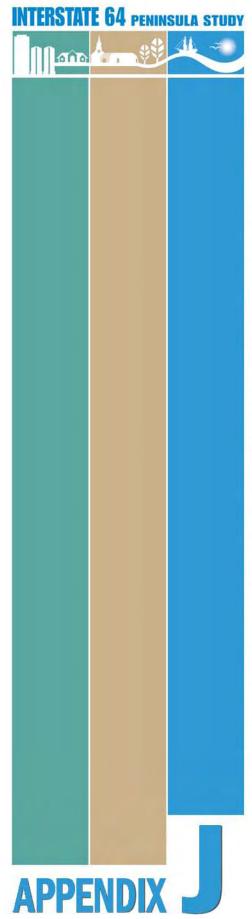

Threatened and Endangered Species, and Other Natural Heritage Resources Information

David A. Johnson Director

COMMONWEALTH of VIRGINIA DEPARTMENT OF CONSERVATION AND RECREATION

203 Governor Street
Richmond, Virginia 23219-2010
(804) 786-1712

MEMORANDUM

DATE:

March 14, 2011

TO:

Nicholas Niess, VDOT

FROM:

Roberta Rhur, Environmental Impact Review Coordinator

SUBJECT:

DCR 11-003, VDOT I-64 Peninsula Study

Division of Planning and Recreational Resources

The Department of Conservation and Recreation (DCR), Division of Planning and Recreational Resources (PRR), develops the *Virginia Outdoors Plan* and coordinates a broad range of recreational and environmental programs throughout Virginia. These include the Virginia Scenic Rivers program; Trails, Greenways, and Blueways; Virginia State Park Master Planning and State Park Design and Construction.

The project crosses the Chickahominy River, a potential scenic resource. As such we recommend that any impacts to the river crossing be mitigated using native plants to stabilized land disturbance in the project area.

Division of Natural Heritage

The Department of Conservation and Recreation's Division of Natural Heritage (DCR) has searched its Biotics Data System for occurrences of natural heritage resources from the area outlined on the submitted map. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, and significant geologic formations.

According to the information currently in our files, numerous natural heritage resources have been documented within 2 miles of the project area (see attached table).

In addition, according to Chris Ludwig, DCR chief biologist, there is potential for Small whorled pogonia (*Isotria medeoloides*, G2/S2/LT/LE) and Swamp pink (*Helonias bullata*, G3/S2S3/LT/LE) to occur in the project area. Small whorled pogonia grows in a variety of woodland habitats in Virginia, but tends to favor mid-aged woodland habitats on gently north or northeast facing slopes often within small draws. It is quite natural for plants of this species to remain dormant in the soil for long periods of time. Direct destruction, as well as habitat loss and alteration, are principle reasons for the species' decline (Ware, 1991). Please note that this species is currently classified as threatened by the United States Fish and Wildlife Service (USFWS) and as endangered by the Virginia Department of Agriculture and Consumer Services (VDACS).

Swamp pink inhabits groundwater-influenced, perennially saturated, nutrient-poor headwater wetlands and is sensitive to hydrologic alterations to its habitat. The major direct threat to this species is habitat loss. Indirect threats result from activities that affect the hydrologic regime including such upslope activities as timber harvesting, land clearing and development, and agriculture. Downstream threats to the hydrology of a swamp pink habitat arise from flooding caused by road crossings with culverts that become blocked and beaver activity (VanAlstine, 1994). In Virginia, swamp-pink is currently known from 45 locations, 3 of which are historic. Please note that this species is currently classified as threatened by the USFWS and as endangered by the VDACS.

Under a Memorandum of Agreement established between the Virginia Department of Agriculture and Consumer Services (VDACS) and the Virginia Department of Conservation and Recreation (DCR), DCR represents VDACS in comments regarding potential impacts on state-listed threatened and endangered plant and insect species. Survey results should be coordinated with DCR-DNH and USFWS. Upon review of the results, if it is determined the species is present, and there is a likelihood of a negative impact on the species, DCR-DNH will recommend coordination with VDACS to ensure compliance with Virginia's Endangered Plant and Insect Species Act.

Furthermore, DCR recommends contacting the Center for Conservation Biology at the College of William and Mary, phone: 757-221-1645 or email: conbio@wm.edu to obtain updated bald eagle information. If bald eagle nests are identified within .25 miles of the project area, DCR recommends coordination with VDGIF to ensure compliance with protected species legislation.

Our files also indicate the Grafton Ponds Natural Area Preserve under DCR's jurisdiction in the project vicinity. For more information concerning this Natural Area Preserve, please contact Rebecca Wilson, Chesapeake Bay Region Steward at (804)225-2303 or rebecca.wilson@dcr.virginia.gov.

New and updated information is continually added to Biotics. Please contact DCR for an update on this natural heritage information if a significant amount of time passes before it is utilized.

The Virginia Department of Game and Inland Fisheries maintains a database of wildlife locations, including threatened and endangered species, trout streams, and anadromous fish waters that may contain information not documented in this letter. Their database may be accessed from http://vafwis.org/fwis/ or contact Shirl Dressler at (804) 367-6913.

Division of Soil and Water Conservation

Erosion & Sediment Control:

Virginia Department of Transportation (VDOT) projects that undertake land-disturbing activities of greater than 2,500 square feet must comply with the most current version of the VDOT erosion and sediment control (ESC) annual specifications approved by DCR. All regulated land-disturbing activities must have a project specific ESC plan developed in accordance with the DCR approved VDOT ESC annual specifications. However, the project specific ESC plan need not be submitted to DCR for approval since VDOT has DCR approved annual specifications. All regulated land-disturbing activities associated with the project, including on and off site access roads, staging areas, borrow areas, stockpiles, and soil intentionally transported from the project must be covered by the project specific ESC plan. Annual specifications must be prepared in accordance with the Virginia Erosion & Sediment Control Law (VESCL) and Regulations (VESCR) and the most current version of the Virginia Erosion & Sediment Control Handbook. [Reference: VESCL §10.1-560, §10.1-564; VESCR §4VAC50-30-30, VESCR §4VAC50-30-40, §4VAC50-30-100]

Stormwater Management:

VDOT projects that undertake land-disturbing activities equal to or greater than 2,500 square feet must comply with the most current version of the VDOT stormwater management (SWM) annual specifications approved by DCR. All regulated land-disturbing activities must have a project specific SWM plan developed in accordance with the DCR approved VDOT SWM annual specifications. However, the project specific SWM plan need not be submitted to DCR for approval since VDOT has DCR approved annual specifications. Annual specifications must be prepared in accordance with the Virginia Stormwater Management Act (VSMA) and the Virginia Stormwater Management Program (VSMP) Permit Regulations. [Reference: VSMA §10.1-603.5; VSMP Permit Regulations §4VAC50-60-160]

General Permit for Discharges of Stormwater from Construction Activities in CBPA:

The operator or owner of construction activities involving land disturbing activities equal to or greater than 2,500 square feet in areas designated as subject to the Chesapeake Bay Preservation Area Designation and Management Regulations adopted pursuant to the Chesapeake Bay Preservation Act are required to register for coverage under the General Permit for Discharges of Stormwater from Construction Activities and develop a project specific stormwater pollution prevention plan (SWPPP). The SWPPP must be prepared prior to submission of the registration statement for coverage under the general permit and the SWPPP must address water quality and quantity in accordance with the Virginia Stormwater Management Program (VSMP) Permit Regulations. General information and registration forms for the General Permit are available on DCR's website at

http://www.dcr.virginia.gov/soil and water/index.shtml

[Reference: Virginia Stormwater Management Law Act §10.1-603.1 et seq.; VSMP Permit Regulations §4VAC50-60 et seq.]

The remaining DCR divisions have no comments regarding the scope of this project. Thank you for the opportunity to comment.

April 5, 2011

Mr. Rich Butala McCormick Taylor, Inc. North Shore Commons A 4951 Lake Brook Drive, Suite 275 Glen Allen, VA 23060

Dear Mr. Butala:

Nicholas Nies, Project Studies Manager, Virginia Department of Transportation (VDOT), has requested that VDACS provide you comments regarding the I-64 Peninsula Study that was the subject of an agency scoping meeting held on March 22, 2011.

VDACS has responsibility for farmland preservation and the protection of endangered and threatened plant and insect species. Regarding the first matter, we encourage those involved in planning highway construction to seek to minimize the loss of agricultural land that may occur. Regarding endangered and threatened species, my staff advises that, although it is unlikely, there is the possibility that endangered plants or insects could occur in the vicinity of the I-64 corridor. There are a number of endangered species which are known to occur in the localities impacted by this project; however, it is not known if these species are found near the interstate. Of those species, the Small Whorled Pogonia, the New Jersey Rush, and the Swamp-pink have the greatest potential for occurring along I-64.

I am sure that VDOT will follow the State Environmental Review Process (SERP) policies to formally consult with the state and federal agencies involved in protection of natural and historic resources. The Department of Conservation and Recreation (DCR) will conduct an initial review of the study area regarding natural resources, including endangered plant and insect species. DCR will then report their findings to VDOT and VDACS.

In closing, VDACS recommends that VDOT consult with appropriate state and federal agencies in order to provide protection for the Commonwealth's natural resources.

Thank you for this opportunity to comment.

Sincerely

Matthew J. Lo

Project Name: I-64 Widening

Subject: List of threatened and endangered species that may occur in your proposed project

location, and/or may be affected by your proposed project.

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, and proposed species, designated critical habitat, and candidate species that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 et seq.), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having

similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2) (c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 et seq.), and projects affecting these species may require development of an eagle conservation plan

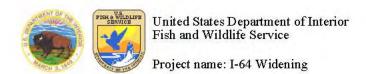

(http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and

http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Endangered Species Act Species List

Species lists are not entirely based upon the current range of a species but may also take into consideration actions that affect a species that exists in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species. Please contact the designated FWS office if you have questions.

Piping Plover (Charadrius melodus)

Population: except Great Lakes watershed

Listing Status: Threatened

Sensitive joint-vetch (Aeschynomene virginica)

Listing Status: Threatened

Small Whorled pogonia (Isotria medeoloides)

Listing Status: Threatened

Swamp pink (Helonias bullata)

Listing Status: Threatened

Species Conclusions Table

Date: October 2012

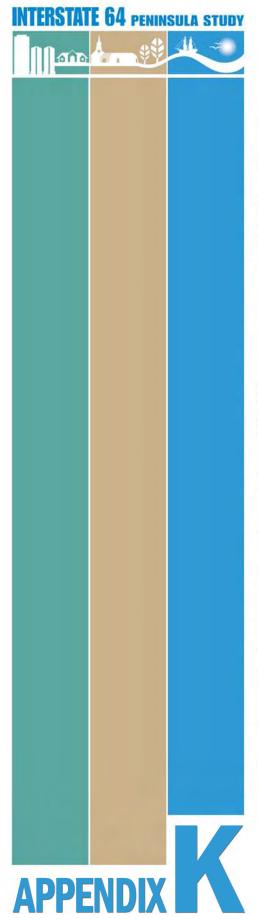

Species Name	Conclusion	ESA Section 7 / Eagle Act Determination	Notes / Documentation			
Potential suitable habitat. Species assessment was conducted as part of this study to identity potential habitat. See assessment report in Appendix L of the Natural Resources Technical Memorandum for details. May adversely affect. Additional coordination required during design phase of this project.		This orchid grows in older hardwood stands of beech, birch, maple, oak, and hickory that have an open understory. Sometimes it grows in stands of softwoods such as hemlock. It prefers acidic soils with a thick layer of dead leaves, often on slopes near small streams.				
Swamp pink (Helonias bullata)	. 마구시크리 :		Variety of wetland habitats including Appalachian bogs and swamps, swampy forests bordering small streams, boggy meadows, and spring seepage areas. Requires constant saturated, but not flooded, forest habitat. Commonly associated with some evergreens, including pitch pine (Pinus rigida), Atlantic white cedar, American larch, black spruce, red spruce, and with red maple. Often grows on hummocks formed by trees, shrubs, and sphagnum moss. The hummocks keep the roots moist but not submerged.			
Piping plover (Charadrius melodus)	No suitable habitat present. Not listed on state agency databases.	No effect.	Piping plovers use wide, flat, open, sandy beaches with very little grass or other vegetation. Nesting territories often include beaches, sand flats, and washovers.			
Sensitive joint-vetch (Aeschynomene virginica)			The Sensitive joint-vetch occurs in fresh to slightly brackish tidal river systems, within the intertidal zone where populations are flooded twice daily. It typically occurs at the outer fringe of marshes or shores; its presence in marsh interiors may be a result of nutrient deficiencies, ice scouring, or muskrat herbivory. The Sensitive joint-vetch is found in			

Species Name	Conclusion	ESA Section 7 / Eagle Act Determination	Notes / Documentation			
			localities where plant diversity is high and annual species are prevalent. Bare to sparsely vegetated substrates appear to be a habitat feature of critical importance for establishment and growth of this species.			
Bald eagle (Haliaeetus leucocephalus)	Potential suitable habitat. Unlikely to disturb nesting Bald eagles. Bald eagle concentration areas are located along the James River (and tributaries) in the vicinity of the project corridor.	An Eagle Act Permit is not likely required; however, coordination with the agencies will continue through the design and permitting phase of the project.	The Bald eagle prefers habitats near seacoasts, rivers, large lakes, oceans, and other large bodies of open water with an abundance of fish. The Bald eagle requires old-growth and mature stands of coniferous or hardwood trees for perching, roosting, and nesting. The Center for Conservation Biology did not list any records of eagle nests within 660' of the project corridor.			
Rafinesque's eastern big-eared bat (Corynorhinus rafinesquii macrotis)	Potential suitable habitat. Numerous forest systems and stream / wetland habitats were identified along the corridor.	May adversely affect. Additional coordination required during design phase of this project.	This bat is rare in Virginia with both subspecies at the edge of their ranges in Virginia. They are uncommon to rare throughout their range, and both seem to be declining. They prefer roosting sites near mature forests and adjacent to rivers and other permanent bodies of water;			
Peregrine falcon (Falco peregrinus)	No suitable habitat present.	No effect.	The species breed in open landscapes with cliffs (or skyscrapers) for nest sites. They can be found up to about 12,000 feet, as well as along rivers and coastlines or in cities. In migration and winter you can find Peregrine falcons in nearly any open habitat, but with a greater likelihood along barrier islands, mudflats, coastlines, lake edges, and mountain chains.			

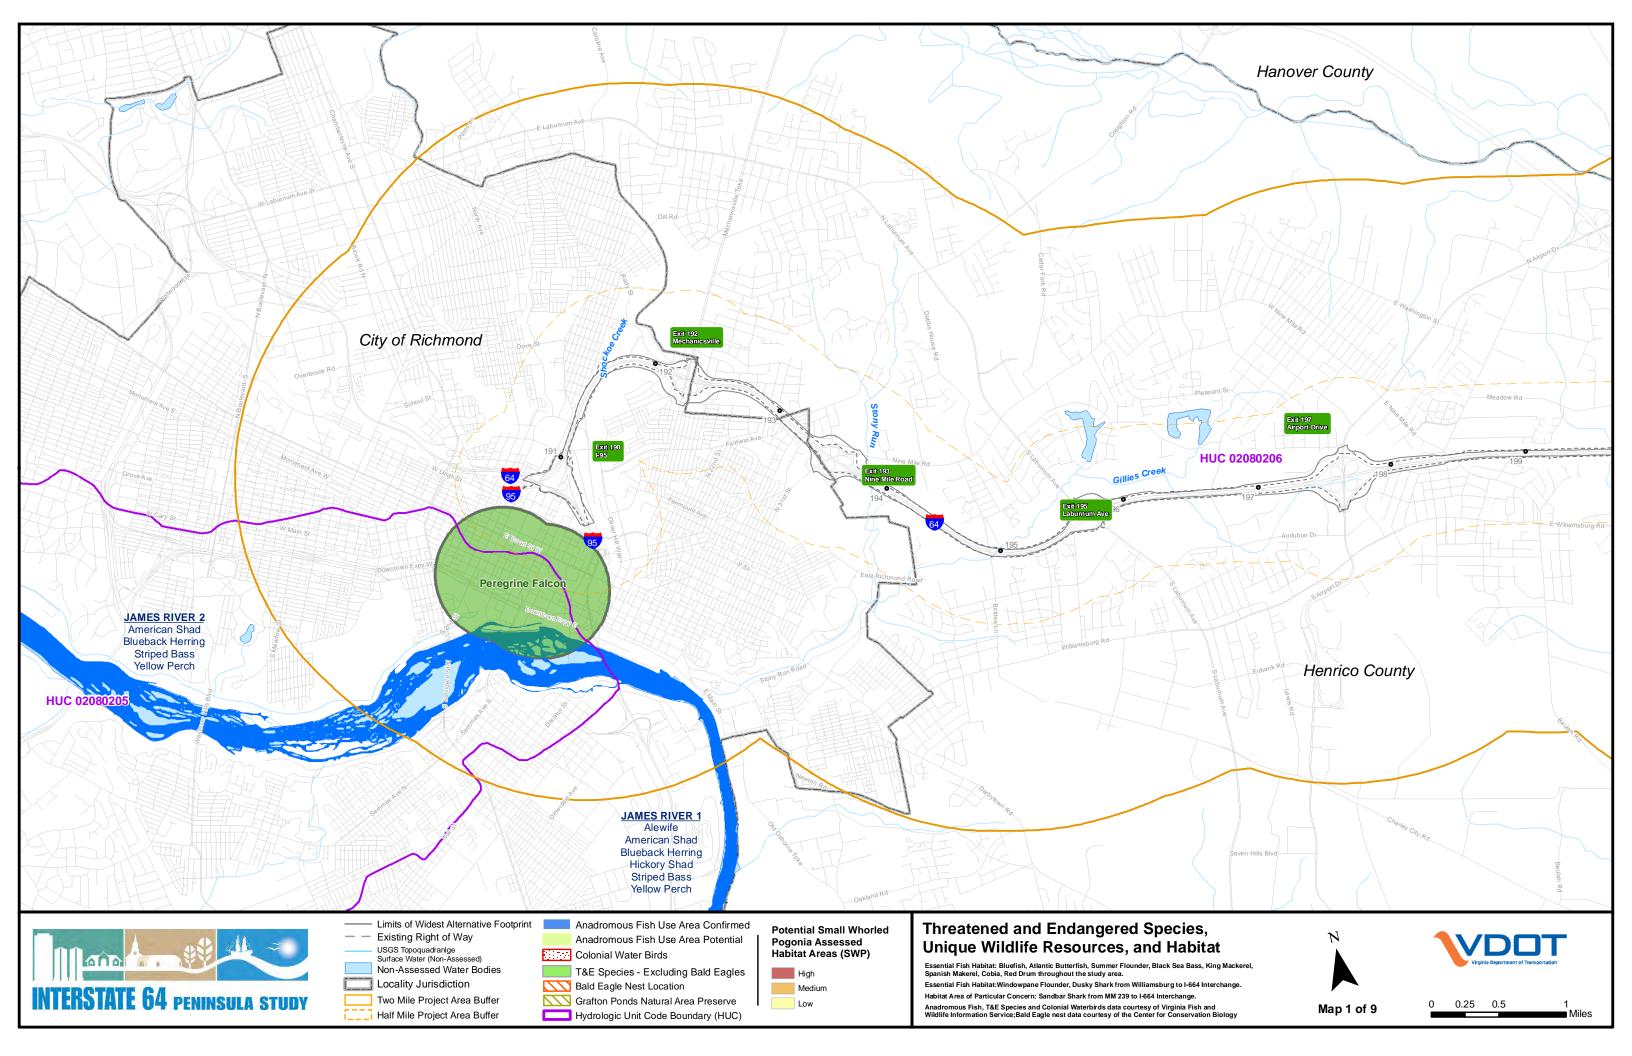

Species Name	Conclusion	ESA Section 7 / Eagle Act Determination	Notes / Documentation			
Canebrake rattlesnake (Crotalus horridus)	Potential suitable habitat. Numerous forest habitats were identified along the corridor.	May adversely affect. Additional coordination required during design phase of this project.	Mature hardwood forests are the preferred habitat of Canebrake rattlesnakes, but the snakes also are found in mixed hardwood-pine forests, cane thickets, and in the ridges and glades of swamps. They prefer areas with numerous logs and a substantial layer of leaves and humus. Canebrakes overwinter in the bases of hollow trees and stumps, and in the underground tunnels resulting from stump and root decomposition.			
Mabee's salamander (Ambystoma mabee)	Potential suitable habitat. Wet woods and swamps were identified along the corridor.	May adversely affect. Additional coordination required during design phase of this project.	Known populations are low in number and tend to be isolated. Their range is restricted to the lower Coastal Plain of the Carolinas and Virginia. The species are found in savannas in burrows at the edges of bogs or ponds and in low wet woods and swamps. Breeding sites in Virginia are fish-free vernal ponds or ephemeral coastal plain sinkholes up to 1.5 meters deep, with surrounding forests generally composed of hardwoods mixed with pine. It is also found in low areas adjacent to coastal rivers and pine savannas, and in bogs, ponds, low wet woods, and swamps.			

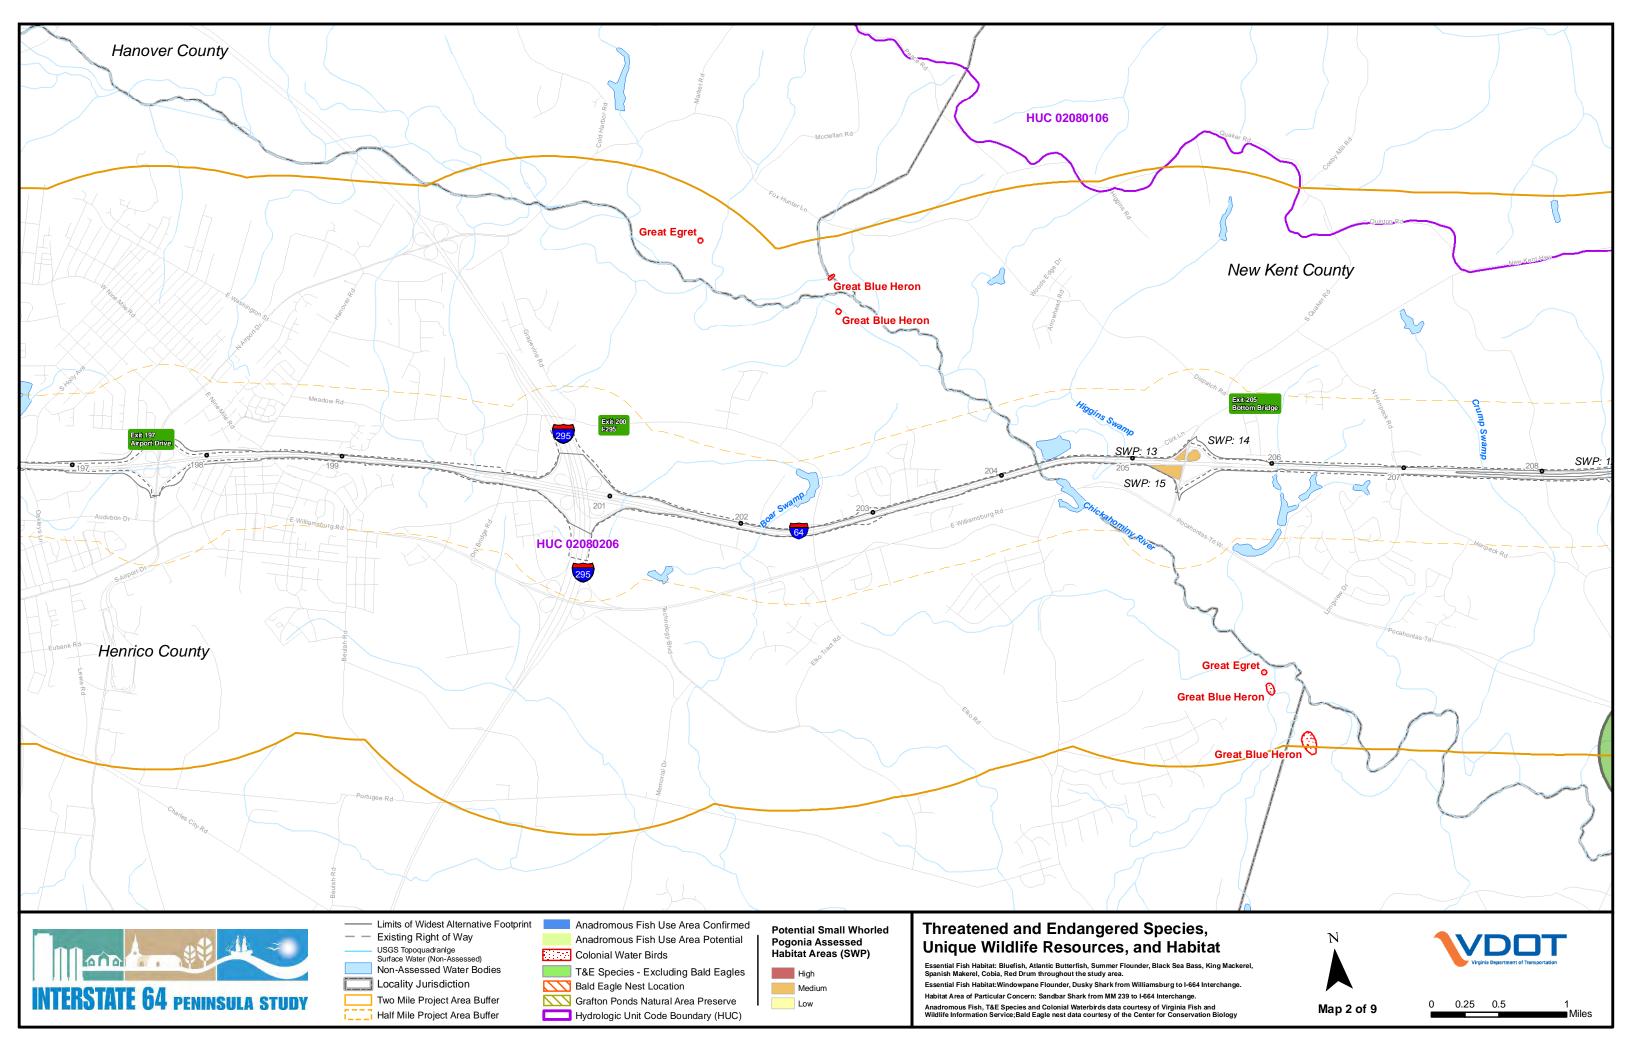

Species Name	Conclusion	ESA Section 7 / Eagle Act Determination	Breeding habitats include limestone sinkhole ponds and Coastal Plain vernal pools associated with wetlands. The terrestrial habitat is only generally described as that with a substrate suitable for burrowing, or sandy areas near shallow pools, chiefly in pine savannas. Unique habitat associations include springs and seeps, vernal pools, bottomland hardwoods and freshwater wetlands. They may inhabit any type of woodland or marshy grassland and are found in leaf letter, debris and humus. According to VDGIF, this species can be considered extant in only two sites in Virginia – Mathews and Augusta Counties.			
Eastern tiger salamander (Ambystoma tigrinum tigrinum)	Potential suitable habitat. Numerous forests and wetland systems were identified along the corridor.	May adversely affect. Additional coordination required during design phase of this project.				
Loggerhead sea turtle (Caretta caretta)	No suitable habitat present. Not listed on state agency databases.	No effect.	This species is found only in salt water, in the Chesapeake Bay from Baltimore south, in all the major rivers along Virginia's coast, and into channels between barrier islands. This species is a wanderer which prefers moderately deep bays, and has been found in streams, marshes and many miles into the sea. Nearly all nesting sites are on barrier islands in the United States. Nesting habitat is a sand beach that is high enough that it is not inundated by high tides nor soaked by groundwater rising from below. The Loggerhead forages in the bay and its estuaries primarily for horseshoe crabs. It would also consume other crustaceans, sea grasses, sponges, fish, mollusks, and snails.			

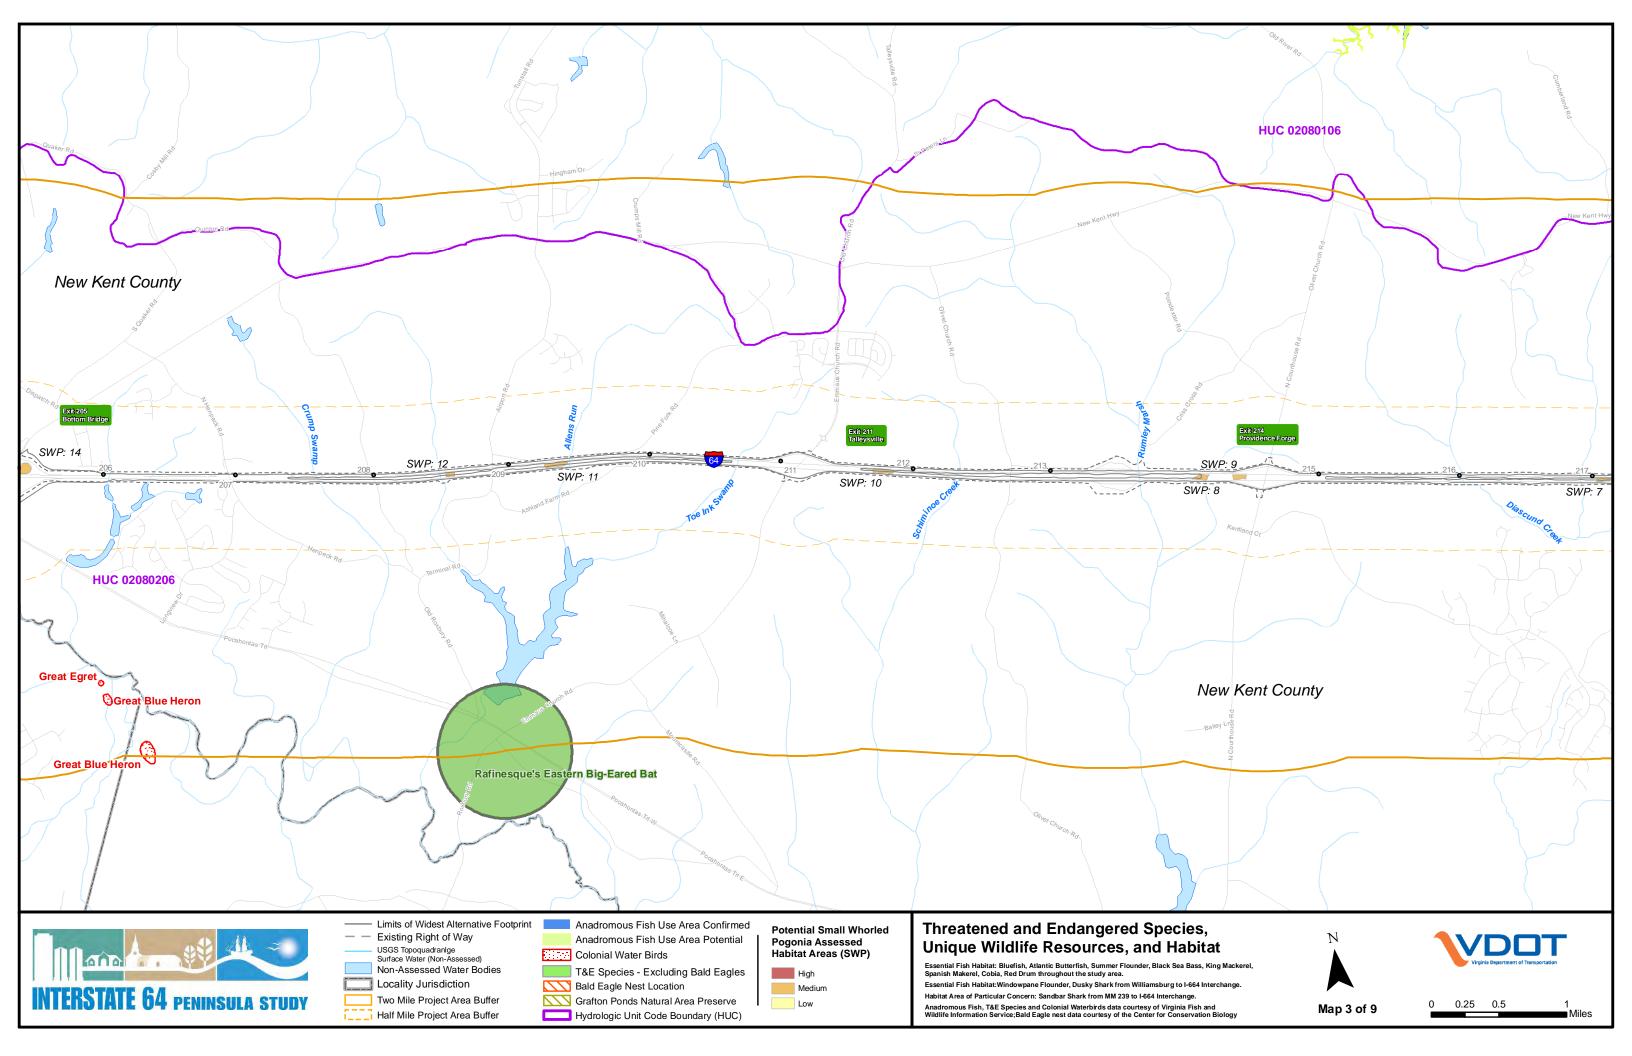

Note: Additional information regarding threatened and endangered species is included in Section J of the *Natural Resources Technical Memorandum*.

Small Whorled Pogonia (*Isotria medeoloides*) Habitat Reconnaissance I-64 Road Improvements Richmond to Hampton, Virginia EEE Project #11-080 May 1, 2012

1.0 Executive Summary

EEE Consulting, Inc. (EEE) conducted a reconnaissance-level habitat evaluation for the Federally-threatened, State-endangered small whorled pogonia (*Isotria medeoloides*) within the existing (as of September 2011) Virginia Department of Transportation (VDOT) right-of-way (ROW) north of westbound travel lanes, south of eastbound travel lanes, within the median, and around interchanges from Richmond to Hampton, Virginia. Potential habitat was identified using a combination of "desktop" review of relevant data resources, "windshield" reconnaissance conducted from a vehicle, and field spot checks of the highest quality habitat areas that were identified by the "desktop" and "windshield" reviews. Fifteen areas identified during the "desktop/windshield" review were checked in the field. Of the fifteen areas that were field reviewed, thirteen were determined to be areas of medium potential habitat, one (Area 2) was characterized as high potential habitat, and one (Area 3) was determined to be low potential habitat. EEE recommends intensive pedestrian surveys of all areas of medium potential and high potential habitat within the project corridor.

The scope of this investigation was limited to a cursory review. Additional small whorled pogonia habitat not identified during this investigation may be present within the project corridor. As the project progresses to the design and permitting stage, a pedestrian survey of all forested areas within the project corridor should be conducted to identify all suitable habitat and to determine presence or absence of small whorled pogonia.

2.0 Introduction

The purpose of this investigation was to identify potential small whorled pogonia habitat within the existing VDOT ROW along the project corridor using "desktop" review, "windshield" surveys, and limited field spot checks. The project involves improvements to Interstate I-64 from Interstate 664 in Hampton to Interstate 95 in Richmond, Virginia. Potential improvements may include the addition of west and east bound travel lanes and interchange improvements.

3.0 Species Description and Habitat Associations

The small whorled pogonia was listed as Federally-endangered for protection under the Endangered Species Act on September 9, 1982 and was reclassified from endangered to threatened on October 6, 1994 (USFWS 1982, 1994). The small whorled pogonia is listed as State-endangered by the Commonwealth of Virginia.

Historically, small whorled pogonia has been documented in 21 states, Canada, and the District of Columbia; however, current estimates report that 93 extant sites representing fewer than 3,000

individuals occur across nine states (NatureServe 2011; USDA, NRCS 2009). In Virginia, most populations occur in the coastal plain and piedmont. Small whorled pogonia has been documented in 21 counties (and one city), including James City County, New Kent County, York County, and the City of Williamsburg (USFWS 2012).

The small whorled pogonia is an herbaceous, perennial orchid (family Orchidaceae) that consists of a single stem (rarely two or more) with a whorl of five or six leaves at the apex of the stem. The stem is hollow and smooth with a glaucous light-green appearance similar to a seedless green grape. Similar species include Indian cucumber root (*Medeola virginiana*), which has a solid, wiry, reddish-brown (sometimes green) stem with cobwebby pubescence and large whorled pogonia (*Isotria verticillata*), which has a reddish stem.

Small whorled pogonia is thought to remain dormant for extended periods (Correll 1950), but Mehrhoff (1989b) found that dormancy periods are typically less than three years. Size of an individual can be a good predictor of reproductive success the following year; with the largest individuals having the largest capsules and highest seed set (Vitt and Campbell 1997). Mehrhoff (1989b) found that the probability of flowering the following year is positively correlated with plant size and that flowering individuals are, on average, the largest plants. Small whorled pogonia is primarily self-pollinating and vegetative reproduction is infrequent (Mehrhoff 1983; Vitt and Campbell 1997). Flowering occurs from May to June when a greenish-yellow, odorless flower with green sepals less than 3 cm long emerges above the whorl of leaves (Radford et al. 1964; Gleason and Cronquist 1991).

Mehrhoff (1989a) found that the most consistent habitat features at sites occupied by the small whorled pogonia are vegetation structure and disturbance history. Small whorled pogonia typically occurs on mesic sites in mixed-deciduous or mixed-deciduous coniferous forests that are generally in second- or third-growth successional stages (USFWS 1992). Most occupied sites have been cutover in the past and allowed to regenerate for at least several decades (Mehrhoff 1989a). Occupied sites typically have sparse to moderate ground cover, a relatively open understory, and proximity to long persisting canopy breaks associated with logging roads, streams, and large tree falls (Mehrhoff 1989a).

In Virginia, the ages of older canopy trees have been estimated to be 45 to 80 years old (Ware 1987). Virginia sites typically contain dry-mesic to wet-mesic soils that are low-nutrient, acidic loams (Mehrhoff 1989a). In Virginia, the soils at occupied sites are typically acidic sandy loams with pH values of 4.3 to 5.5; however, the soil from one site in Virginia was described as a silt loam (Ware 1991). The forest floor is typically flecked with sunlight and is covered with a light to thick layer of leaf litter with limited exposed rock and soil (USFWS 1992; Mehrhoff 1989a). Small whorled pogonia generally occurs on gentle to moderate slopes with eastern or northern exposures, although the plant has been documented on all slope aspects (Ware 1991). Decaying woody debris is also present at most occupied sites and, like many orchids, mycorhizzal associations likely play a prominent role in nutrient uptake (USFWS 1992).

Mehrhoff (1989a) did not identify unique indicator species, but red oak (*Quercus rubra*) and red maple (*Acer rubrum*) were present in the canopy of all occupied sites. In Virginia, typical canopy species associated with small whorled pogonia are white oak (*Quercus alba*), black oak (*Q. velutina*), scarlet oak (*Q. coccinea*), sweetgum (*Liquidambar styraciflua*), tulip tree (*Liriodendron tulipifera*), and American beech (*Fagus grandifolia*). Typical understory and shrub species include flowering dogwood (*Cornus florida*), sourwood (*Oxydendrum arboreum*), mountain laurel (*Kalmia latifolia*), American chestnut (*Castanea dentata*), and witch hazel (*Hamamelis virginiana*). Typical ground cover species are partridge berry (*Mitchella repens*), Indian cucumber root, New York fern (*Thelypteris noveboracencis*), lowbush blueberry (*Vaccinium pallidum*), rattlesnake plantain (*Goodyera pubescens*), red maple seedlings, oak species seedlings, Virginia creeper (*Parthenocissus quinquefolia*), naked tick-trefoil (*Desmodium nudiflorum*), catbrier (*Smilax glauca*), and Christmas fern (*Polystichum acrostichoides*). (USFWS 1992).

Two known sites in Prince William County, Virginia, visited by EEE staff from 2008 to 2011 were noted to have the following associates:

Prince William County Location #1:

The canopy was dominated by American beech, red maple, white oak, pignut hickory (Carya glabra), southern red oak (Quercus falcata), tulip tree, and sweet gum. The dominant saplings were black gum (Nyssa sylvatica), American beech, red maple, American holly (Ilex opaca), and pignut hickory. The dominant herbs were southern ground cedar (Lycopodium digitatum), strawberry bush (Euonymus americana), lowbush blueberry, red maple, pignut hickory, beechdrops (Epifagus virginiana), mapleleaf viburnum (Viburnum acerifolium), black cherry (Prunus serotina), and Virginia creeper. No vine or shrubs were present at this location.

Prince William County Location #2:

The canopy was dominated by tulip tree, pignut hickory, white oak, and American beech. The sapling/shrub dominants were blackgum, American beech, ironwood (*Carpinus caroliniana*), and American holly. The herbaceous layer was dominated by southern ground cedar, American beech, naked-flowered tick-trefoil, sessile leaf bellwort (*Uvularia sessilifolia*), strawberry bush, New York fern, Christmas fern, partridgeberry, lowbush blueberry, and striped wintergreen (*Chimaphila maculata*).

4.0 Methodology

Potential small whorled pogonia habitat was initially identified using a combination of "desktop" review of relevant data resources (e.g., site topography, USGS topographic quadrangle maps, National Wetlands Inventory maps; NRCS soils map data, the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps, natural color aerial imagery, and color infrared aerial imagery) and "windshield" reconnaissance conducted from a vehicle. Field spot checks

were then conducted on 15 areas of potential habitat identified during the "desktop/windshield" review. This habitat reconnaissance was conducted within the existing (as of September 2011) VDOT ROW north of westbound travel lanes, south of eastbound travel lanes, within the median, and around interchanges from Richmond to Hampton, Virginia.

Field review of the 15 habitat areas was conducted by EEE environmental scientists Taylor S. Sprenkle and Tamara Doucette on August 30 and September 1, 2011. Mr. Sprenkle is included on the U.S. Fish and Wildlife Service's list of approved surveyors for the small whorled pogonia.

Potential small whorled pogonia habitat was evaluated based on criteria developed from literature review, research conducted in Virginia, and the personal experience of EEE staff. Habitat quality was divided into three categories: low potential, medium potential, and high potential as follows:

High potential habitat areas possess almost all of the physical and biological characteristics of optimal habitat described for small whorled pogonia in Virginia (Ware 1991; USFWS 1992).

Medium potential habitat approaches optimal habitat but lacks one or more key habitat characteristics. Habitat that would otherwise be considered high potential, would be considered medium potential if:

- steep slopes are present;
- the slope aspect faces a direction other than north to southeast (i.e., west);
- scattered individuals of "dry" species such as Virginia pine (*Pinus virginiana*), chestnut oak (*Quercus prinus*) or black locust (*Robinia pseudoacacia*) are present;
- the understory or ground cover is moderately dense; or
- soils are not typical of soil types associated with suitable habitat.

Low potential habitat would have little to no potential to support the small whorled pogonia. Habitat is considered low potential if:

- the area is dominated primarily by chestnut oak or Virginia pine;
- the forest is relatively young;
- the area is heavily disturbed
- the area is dominated by exotic species;
- the understory is extremely dense;
- the area is very dry or very wet; or
- very steep slopes are present with little leaf litter.

5.0 Habitat Evaluation Findings

The majority of the project corridor would be considered low potential habitat including non-forested areas (e.g., mowed roadsides and lawns, landscaped areas, buildings, pavement. etc.) and forested areas that are wetlands, are heavily disturbed, have an extremely dense understory, are heavily dominated by xeric species such as chestnut oak or Virginia pine, or are heavily dominated by invasive species such as Japanese honeysuckle, tree-of-heaven (*Ailanthus altissima*), common periwinkle (*Vinca minor*), or English ivy (*Hedera helix*).

Fifteen forested areas were identified during the "desktop/windshield" review as warranting field review. Of the fifteen areas that were field reviewed, thirteen were determined to be medium potential habitat, one (Area 2) was characterized as high potential habitat, and one (Area 3) was determined to be low potential habitat.

Area 1

This medium potential habitat is situated on level ground within the northwest loop of the interchange cloverleaf at exit 250. The canopy is dominated by red maple, American holly, white oak, loblolly pine, tulip tree, black gum and sweet gum. The sapling/shrub dominant is American beech. The herbaceous dominants include greenbrier (*Smilax rotundifolia*), lowbush blueberry, willow oak (*Quercus phellos*) and muscadine (*Vitis rotundifolia*). The understory is very sparse with thick leaf and pine needle litter and a wet feature at the bottom of a slight slope. Although several indicators of high quality habitat are present, field observations suggest that the hydrologic regime may be more hydric than ideal for small whorled pogonia; therefore, this habitat was classified as medium potential.

Area 2

This high potential habitat is located within a "triangle" of land bordered to the northeast by I-64, to the northwest by Merrimac Trail (Route 143), and to the south by the eastbound access ramp to I-64. This habitat has gentle slopes with an ephemeral channel at the base of the slope and sun flecking. The herbaceous layer was sparse with abundant leaf litter and abundant decaying woody material. The canopy in this area is dominated by white oak, American beech, American holly, loblolly pine, red oak, tulip tree and sweet gum. The sapling/shrub dominants include mockernut hickory (*Carya alba*), red oak, American beech, white oak, southern red oak, devil's walking stick (*Aralia spinosa*), eastern red cedar, southern magnolia (*Magnolia grandiflora*) and pignut hickory. The herbaceous layer dominants include partridge berry, lowbush blueberry, muscadine and multiflora rose (*Rosa multiflora*).

Area 3

This low potential habitat in the median at mile marker 228 is situated on a steep west facing slope. The canopy in this area is dominated by tulip tree, white oak, sweet gum and red maple. The sapling/shrub layer is dominated by mountain laurel and the herbaceous layer is dominated by muscadine and partridge berry. The shrub layer is thick and dominates the forest floor. Due

to the steep slope, west facing slope, and thick understory, this site was classified as low potential.

Area 4

This medium potential site is situated on a gentle to moderate slope in the median near mile marker 224. The tree canopy is dominated by American holly, white oak, American beech, sourwood, tulip tree, red oak, sweet gum and southern red oak. The sapling/shrub layer is dominated by mountain laurel, American holly, lowbush blueberry and white oak. The herbaceous layer is dominated by lowbush blueberry.

Area 5

This medium potential site is situated on an east facing slope in the median near mile marker 221. The tree canopy is dominated by red maple, sweet gum, white oak, tulip tree, southern red oak, American beech, loblolly, swamp white oak, American holly and mockernut hickory. The sapling/shrub layer is dominated by sweet gum, ironwood, devil's walking stick and mockernut hickory. The herbaceous layer is dominated by partridge berry. The understory in this area is sparse with sun flecking, thick leaf litter, east facing slope and a perennial stream and wet feature at the bottom of the slope. Although several indicators of suitable habitat are present, the slope in this area is moderate to steep and is therefore classified as medium potential.

Area 6

This medium potential habitat is located in the median at mile marker 219. This habitat area has a sparse understory and herbaceous layer, sun flecking, abundant woody debris, thick leaf litter, moderate west facing slope and a stream feature at the base of the slope. The tree canopy is dominated by white oak, American holly, American beech and loblolly. The sapling/shrub layer is dominated by American holly, red oak, sweet gum and red maple. The herbaceous layer is dominated by lowbush blueberry, mockernut hickory and smooth carionflower (*Smilax herbacea*).

Area 7

This medium potential site is located in the median near mile marker 217. The tree canopy is dominated by loblolly, white oak, pignut hickory, American beech, red maple and eastern red cedar. The sapling/shrub layer is dominated by pignut hickory and American holly. The herbaceous layer is dominated by smooth carionflower, muscadine, and partridge berry. The area has a sparse understory and herbaceous layer, sun flecking, abundance woody debris, thick leaf litter and a gentle west-facing slope. Although the area contains indicators of high quality habitat, the west-facing slope is not ideal for small whorled pogonia; therefore, this area is classified as medium potential habitat.

Area 8

This medium potential area is located in the median near mile marker 214. The tree canopy is dominated by American holly, white oak, pignut hickory, southern red oak, tulip tree and

loblolly. The sapling/shrub layer is dominated by American holly and eastern red cedar. The herbaceous layer is dominated by white oak, pignut hickory, red oak, longleaf woodoats (*Chasmanthium sessiliflorum*), Bosc's panicgrass (*Dichanthelium boscii*) and lowbush blueberry. The site has a sparse understory, thick leaf litter, moderate woody debris, moderate east facing slope and sun flecking.

Area 9

This medium potential site is located in the median approximately 500 feet west of exit 214. This habitat area is characterized by a sparse herbaceous layer and a gentle western facing slope. The tree canopy is dominated by fringe tree (*Chionanthus virginicus*), American holly, white oak, southern red oak, pignut hickory, sweet gum, red maple, tulip tree and red oak. The sapling/shrub layer is dominated by fringe tree, American holly, white oak, sweet gum and black cherry. The herbaceous layer is dominated by lowbush blueberry, muscadine, pignut hickory, poison ivy (*Toxicodendron radicans*), sassafras (*Sassafras albidum*) and poison oak (*Toxicodendron pubescens*).

Area 10

This medium potential site is located in the median near mile marker 212. It is characterized by gentle to moderate east and west facing slopes, spare to moderate herb cover and dense leaf litter. The tree canopy is dominated by red oak, white oak, American holly, American beech, Virginia pine, loblolly pine, sweet gum and pin oak (*Quercus palustris*). The sapling/shrub layer is dominated by red oak, American holly, sweet gum and black cherry. The herbaceous layer is dominated by red oak, white oak, sweet gum, muscadine, lowbush blueberry, greenbriar and poison ivy. Although this area has indicators of suitable habitat, the presence of exotics and xeric species such as Virginia pine and abundant herbaceous cover indicates moderate potential habitat.

<u>Area 11</u>

This medium potential site is located in the median near mile marker 210. The tree canopy is dominated by white oak, flowering dogwood (*Cornus florida*), tulip tree, American hornbeam (*Carpinus caroliniana*), sweet gum, red oak and black cherry. The sapling/shrub layer is dominated by tulip tree, sweet gum, read oak, sassafras, American holly, lowbush blueberry and pignut hickory. The herbaceous layer is dominated by pignut hickory, spicebush (*Lindera benzoin*), sweet gum, tulip tree, greenbriar, Virginia creeper and muscadine. This area has a sparse understory, sun flecking, moderate southeast facing slope and abundant leaf litter.

Area 12

This medium potential site is located in the median near mile marker 209. The tree canopy is dominated by ironwood, river birch (*Betula nigra*), white oak, American holly, sweet gum, tulip tree, loblolly and water oak (*Quercus nigra*). The sapling/shrub layer is dominated by American beech, ironwood, American holly and pignut hickory. The herbaceous layer is dominated by lady fern (*Athyrium filix-femina*), greenbriar, Virginia creeper and Japanese honeysuckle. The

slope is moderate to steep and southwest facing with a stream at the base. The herbaceous cover is moderate with leaf litter and woody debris.

Area 13

This medium potential site is located in the exit 205 interchange northwest of the intersection between I-64 and New Kent Highway (Route 249). The tree canopy is dominated by American holly, read oak, white oak, American beech, tulip tree, sweet gum and sassafras. The sapling/shrub layer is dominated by American holly, American beech and black gum. The herbaceous layer is dominated by American holly, white oak, muscadine, greenbrier, Virginia creeper and sweet gum. This area is relatively flat and does not have a stream or wetland in the vicinity, but abundant woody debris, sun flecking and thick leaf litter make this medium potential habitat.

Area 14

This medium potential area is located within the northeast loop of the exit 205 interchange. The tree canopy is dominated by beech, pignut hickory, white oak, tulip tree, sweetgum and loblolly. The sapling/shrub layer is dominated by American beech, American holly, sweet gum and black gum. The herbaceous layer is dominated by burning bush and American holly. The area lacks slope or a water feature but has abundant woody debris, sun flecking and thick leaf litter.

Area 15

This medium potential site is located in the exit 205 interchange on the south side of interstate 64 and the west side of New Kent Highway (Route 249). The tree canopy is dominated by American beech, red oak, tulip tree, sweet gum, white oak and loblolly. The sapling/shrub layer is dominated by American beech and American holly. The herbaceous layer is dominated by American burnweed (*Erechtites hieraciifolia*), white oak and muscadine. The area lacks slope or a water feature but has abundant woody debris, sun flecking and thick leaf litter with sparse herbaceous cover. The site has evidence of previous fire and a duff layer approximately 3 inches thick.

6.0 Conclusions

In our opinion, the areas of the project corridor that have little to no potential to support small whorled pogonia would not warrant a survey for small whorled pogonia (subject to concurrence from relevant resource agencies). These areas include non-forested areas (e.g., mowed roadsides and lawns, landscaped areas, buildings, pavement. etc.), wetlands, and areas that are forested but are heavily disturbed, have an extremely dense understory, are heavily dominated by xeric species such as chestnut oak or Virginia pine, or are heavily dominated by invasive species such as Japanese honeysuckle, tree-of-heaven (*Ailanthus altissima*), common periwinkle (*Vinca minor*), or English ivy (*Hedera helix*).

EEE recommends intensive pedestrian surveys of all areas of medium potential and high potential habitat within the project corridor.

7.0 Limitations

A presence/absence survey for small whorled pogonia was not conducted during this habitat reconnaissance. This habitat reconnaissance was conducted within the existing (as of September 2011) VDOT ROW north of westbound travel lanes, south of eastbound travel lanes, within the median, and around interchanges from Richmond to Hampton, Virginia. The scope of this investigation was limited to a cursory review. Additional small whorled pogonia habitat not identified during this investigation may be present within the project corridor. As the project progresses to the design and permitting stage, a pedestrian survey of all forested areas within the project corridor should be conducted to identify all suitable habitat and to determine presence or absence of small whorled pogonia. A presence/absence survey should be conducted within the timeframe recommended by the U.S. Fish and Wildlife Service (May 25 to July 15 for the project corridor). The determination whether or not to conduct a small whorled pogonia survey is subject to review and concurrence from the relevant resource agencies.

This study is based on examination of the habitat conditions at the time of this study and does not address conditions at a given time in the future as habitat conditions may change over time. Therefore, the conclusions of this study may differ from future observations.

EEE's habitat evaluation has been conducted in accordance with generally accepted guidelines for the conduct of surveys for rare, threatened, and endangered plants. EEE makes no warranties, either expressed or implied, and this report is not a recommendation for actions along the study corridor.
